Hello,

I uploaded a FAQ file on the Delorme Tripmate to Peter Bennett's FTP site
at:

ftp://sundae.triumf.ca/pub/peter/index.html

It is invisible in the incoming directory, but should be posted within a
few days.

>73 Eric eac@shore.net

I realized my mistake right after I sent that message. I had the GPS
sitting on the windowsill and hadn't let it run long enough to lock on
any birds. However I noticed that, when INIT'ed with the Tripmate.exe
program, the GPS starts sending more than the two cold start strings
back immediatly. Obviously that program is telling the GPS more then ASTRAL.

Anyway thanks for the info..

I'm trying to run WinAPRS 117 w/ KPC-3 on a laptop 486 and a Garmin 45 and I
have problem. I tried hooking up the tnc and gps45 to an AEA APRS Cable but
the port won't open. How do I get the APRS Cable to work. The KPC-3 and the
GPS 45 work great separately w/ the computer, but not together using the
APRS Cable. Any help wwould be greatly appreciated.

Rendered body type: text/plain

Hello,

SA 4.0 sends the time/date and last position to the unit after the ASTRAL.
On a cold start without this init string the Tripmate does not have the
correct time. After it recieves a satellite and gets it's ephemeris it then
has the correct time so it starts outputing the other strings. Before the
receiver has a real position alot of the fields are blank. Note that the
position valid field in RMC is set to invalid, but it still outputs a position.

Interesting comment regarding the disconnect switch on the PK 232. In my
case I used the switch formerly used to reverse mark/space on UO11!
Now that AEA seems unable to provide chips for APRS would you suggest
what might be done to use the PK232 without the AEA provided chip?
Of course on 10.151 MHz no mods are required but what can be done on VHF?

211. Mic-E Repeater TNC for muting

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Mon, 9 Dec 1996 13:50:57 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.GSO.3.95.961209132947.7202D-100000@arctic>
Rendered body type: text/plain

Remember last week that the guys in Charlottsville, VA discovered that
the internal software DCD of the KPC-3 cannot be used for repeater
muting at the same time as the external XCD signal for CSMA on the
digital channel.

This means you can have packet MUTING on the voice repeater (using
software CD) *OR* CSMA colision avoidance on the APRS packet channel
using the XCD signal....

BUT NOT BOTH AT THE SAME TIME..

Even if Kantronics had allowed the XCD and software CD to both be active,
this wont work either because you would be MUTING voice sylables whenever
there were ANY packets on the APRS channel!!

This makes the standard PacComm Tiny-2 TNC with the add on True-DCD
state machine still the best solution. There are 2 reasons for this:

1) both the True DCD and radio-squelch external input are active at the
   same time..

2) the output of the True-DCD circuit is INDEPENDENTLY available for
   voice rpeeater muting independent of what is going on via the
   radio-squelch circuit on the APRS packet channel.

I assume that a series diode may be needed to provide this muting output
independent of the squelch external input. Can someone who has the
experience with these state machine true DCD circuits publish the details
needed to accomplish this objective.. I have never seen one...

P.S. YOu have heard me say that the muting is not so important... well,
after listening to 12 hours of the Mic-E being used for the Army/Navy
football run, I agree, it gets tiring!   Of course, this was worst case
scenario since we had the path set to RELAY,WIDE,WIDE whcih DOUBLED the
length of the packets... ALso the deviation was too high.. which further
added to the insult..

212. Mic-E scanner method

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Mon, 9 Dec 1996 14:41:30 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.GSO.3.95.961209143347.27855A-100000@arctic>
Rendered body type: text/plain

When you get your Mic-E and want to be tracked by everyone immediately,
even before any of your local repeaters install TNC digipeaters, you have
2 choices:

1) simply dial in 145.79 occasionally and kerchunk your Mic whenever you
want to report your position.

2) Put a TNC at your house listening to the voice repeater output and
digipeating over to 145.79.

Actually, you can extend this to a scanner, scanning several of your
favorite repeaters. If it hears your packet on any of the repeaters, then
it will digipeat over to 145.79.. The only disadvantage is if all of the
repeaters stay kinda busy, then the scanner maybe on the wrong freq at the
wrong time... But it will work nicely for relatively quiet repeaters.

Just a thought...

213. NMEA/GPS questions...

From: Don Pfister KA0JLF <donp@jerryc.tyrell.net>
Date: Mon, 9 Dec 1996 14:03:28 -0600 (CST)
To: tapr aprssig <aprssig@tapr.org>
Message-ID: <Pine.LNX.3.91.961209135405.27687A-100000@jerryc>
Rendered body type: text/plain

I see the NMEA GPS lat/long is in ddmm.mmmm format. Are these truely
decimal minutes? Would .0001 be .0001 of a minute?

Does this sound right? From the refernces I have found, it says one degree is made up of 60 minutes. One minute is made of 60 seconds. It says one second at the equater is 1 nautical/geographic mile. One nautical mile is 6080 feet. So 60 x 6080 = 364800 feet (at the equator - long. I think). Now .0001 x 364800 = 36.84 feet. Am I on the right track? If so what do you do when you move away from the equator? What about Lat.?

Wouldn't that mean that APRS uses .01 as the smallest amount of procession, wouldn't that be 3648 feet? The 80 meter filter would be 264 feet so, I must be wrong.

Can anyone help clear this up for me?

Confused (must be another out of mind experience) ;^)

73 de Don KA0JLF (not it's really not me but someone trying to make me look bad (duh) ;^)

Thanks

Bob, who has now had to listen to his packets for a while:-), said:

>I assume that a series diode may be needed to provide this muting output
>independent of the squelch external input. Can someone who has the
>experience with these state machine true DCD circuits publish the details
>needed to accomplish this objective.. I have never seen one...

Following based on a TINY-2:

The "true DCD" modification kit from TAPR just sits in between the FSK modem DCD output and the DCD input to the Z80. Basically, the TCM3105 claims to see DCD for any old reason (like overdriven audio or 1200/2200 Hz speech components). The DCD state machine uses that as a starting point to look more closely at the signal and then asserts it's DCD output based on real NRZI data being seen. You hook it up by just sticking it in between the jumpers that choose between internal DCD (TCM3105 output) and external RFDCD.

Note, following is from memory so I don't have the necessarily correct jumper numbers listed:

So, before, for a vanilla TINY-2:

```
external RFDCD  -----* 1
                   2 *-----> DCD in to Z80 I guess...
TCM3105 DCD out -----* 3
```

Jumper 1&2 together for RFDCD. Or jumper 2&3 together for TCM3105 DCD.

```
------------------------------------------------------------------------
After installing DCD state machine:

external RFDCD  -----* 1
true DCD out     +---*-----> DCD in to Z80 I guess...
TCM3105 DCD out ----+* 3
                 |  |
                 |  |
                 |  +--->DCD state machine input
                 +------<DCD asserted by state machine
                    ...  bunch of other places the state machine hooks
                         to the TNC guts to actually look at the bit
                         stream, obtain power, clock, etc.
```

NO jumper permited anymore between 1&2 or 2&3. External RFDCD no longer an option without internal rewiring.

So, yeah, you need to make it so that the mute comes from the true DCD out with a diode before ORing in the RF DCD detect from the 145.79 receiver.

Since external DCD is no longer allowed, one might consider stealing it for the repeater mute line:-) I would recommend diode-protecting this for obvious reasons.

It would be truly nice to only cause packet transmit holdoff when 145.79 is busy. Currently, this one TNC killing two birds stuff means that holdoff happens more than it should -- when packets are being received from mobiles on the repeater as well as when packets are being heard on 145.79.

/a

>what do you do when you move away from the equator? What about Lat.?
>

Still OK, if I understand what you are trying to say. One second of latitude is always a nautical mile. One second of longitude varies with the latitude (roughly, this assumes the earth is a perfect sphere):

distance-of-longitude(in nautical miles) =
seconds-of-longitude*cos(latitude)

>Wouldn't that mean that APRS uses .01 as the smallest amount of
>procession, wouldn't that be 3648 feet? The 80 meter filter would be 264
>feet so, I must be wrong.
>

APRS protocol uses three decimal places, roughly 360 feet precision, max error would be half that value. Conveniently close to the accuracy (not the precision) of GPS. The filter (in javAPRS, and I guess in other APRS programs) is applied to the GPS input data, which is the 4 decimal place data you describe above.

So, any time a station sending its position with the APRS protocol (3 decimal places) changes at all it will be over the 80 meter limit (unless in the extreme north/south and the change is only longitude). However, it had to get its data from somewhere, namely a GPS, with it's 4 digit precision, and that is where the filter is applied.

Of course, if the station is transmitting data from a stand-alone tracker, then the filter is applied at the receiving station.

Hope this helps...I get confused too...

Steve K4HG

218. Some little Tripmate stats

From: Dick Mead <mead@usc.edu>
Date: Mon, 09 Dec 1996 15:05:04 -0800
To: aprssig@tapr.org
Message-ID: <32AC9B20.D15@usc.edu>
Rendered body type: text/plain

Trip attached to 6VDC power supply:

Current drain OFF = 0.13mA
Current drain ON = 98Ma (approx)

If the Tripmate is on and voltage is reduced from 6 to 5VDC, current drain INCREASES to 120mA (approx)

If you fire up Atlas4.0 and Tripmate, the GPS is NOT powered off when you exit the program. You will have to power down the PC or unplug the Tripmate. I see no mention of this in the docs...

FYI

>Thanks
>
Don etal
I think that you computed the number of feet in a degree and multiplied
by
.0001 rather than start out with a minute.
If you multiply the feet in a minute by .0001 you get .6 feet as an
answer;
6076 x .0001
This holds true for latitude or for distances on the face of the earth.
However longitude because of convergence towards the poles diminishes the

further north or south you go. The way to compute the distance of
longitude
at a given latitude is to multiply the length at the equator by the
Cosine of
the latitude. i.e. a minute (6076')at the equator times the cosign of
the
latitude for example 45 degrees (0.707107) would equal 4296.4 feet.
A easy quick reference is that one second (1/60 of a minute) of latitude
is
about 101.2 feet or at 45 degrees north or south 101.2 x .7071 = 71.6
feet.
I hopes this helps.

220. Help with HSP and U2000/KPC-3

From: "Don Murray" <james-m@ix.netcom>
Date: Mon, 9 Dec 1996 18:37:23 -0500
To: <aprssig@tapr.org>
Message-ID: <199612092337.PAA08371@dfw-ix8.ix.netcom.com>
Rendered body type: text/plain

Thanks for reading this..

I am attempting to get my KPC3/U2000/AES HSP cable up and running. I am
having a problem getting it all to work together. Here is what I am
doing,
and I am open for any and all suggestions..

1) Have the AES HSP cable connected to the back of the Kpc-3, and have a
cable running from the back of the AES HSP to my computer.
2) I removed the plug that came on the HSP cable and replaced it with a
db9
connection to allow me to connect the U2000 to the HSP GPS connection. I

am pulling the signal off of the grn and black wires from the U2000.
3) I load up APRS and set HSP on from the gps selection. I get a HSP
timeout error from aprs with this setup..

I can go to the tnc terminal mode and toggle hsp F-8, and I get a string
of
characters mostly JJJJJJJJs scrolling accross the screen. Makes me think
I
have the baud rate set wrong, I have tried everything I can to set the
baud
rates correctly and have had no luck..

I have attempted to plug the HSP cable directly into the computer and then
cable back to the TNC.. I get nothing when I then toggle HSP with the F-8
key form the tnc terminal.. This makes me thing their is something wrong
with the signal power..

If anyone is using an AES hsp cable with a U2000, please let me know how
they are doing it..

Again thanks for any and all help with this..

Don Murray-

You can't do HSP with a WX station. WX must have its own port on your PC.
HSP is for combining a GPS and a TNC into 1 RS232 port.
Sorry

Hi Jaques,

Here are those articles. 73

The Automatic Position Reporting System
An Overview and Introduction
by Arte Booten N2ZRC

Many of you have heard discussions about a packet radio program called The Automatic Position Reporting System, (also called APRS.) It's a system which, unlike PBBS's, nodes and DX clusters, uses an unconnected protocol to transmit your exact position, a symbol denoting the type of station you're running and a brief comment about it. It also uses direct keyboard-to-keyboard "chatting," has direction-finding capabilities and much more.

How does it work? In a simplistic form you transmit a packet which contains your callsign, exact latitude and longitude, information on your transmitter's power, your antenna's height, gain and pattern as well as a brief comment of your choosing along with some symbols necessary to make the system work. With this information your station appears graphically on a map (actually, one in a series of many maps) on the monitor as would other stations that are on frequency. Since this is an UNCONNECTED protocol, on-air packets can be kept to a minimum.

Consider this: When you connect to a local station using standard AX.25, you send a connect request to that station, they acknowledge that packet, send you a connected packet which you must then acknowledge. The same thing happens with EVERY packet you, or the other station, sends. With APRS you only send ONE packet to convey your information. If it's not received on the first transmission, APRS retransmits it using a decaying time delay (that is, the second packet is sent twenty seconds after the first, the third forty seconds later, the fourth a minute later, the fifth two minutes later etc. until, after a day, you're only sending six packets a day!) This makes more efficient use of the frequency.

APRS uses four different kinds of digipeaters, which use the aliases RELAY, WIDE, ECHO and GATE. RELAY stations (the default setting) are base stations used to digipeat low-power portable and mobile stations. WIDE stations will digipeat packets addressed either to their specific callsign or the generic WIDE to other VHF stations and WIDEs. An ECHO performs a similar function on HF and a GATE digipeats either from VHF to HF, HF to VHF or HF to HF. When setting up APRS for your location you'll set your digipeater path based on the situation at that QTH and where you want your information to go. When using APRSDos (and soon WinAPRS and MacAPRS) for keyboard-to-keyboard communications, which are the only comms in which *ACK*'s are used, you can also set alternate digipeater paths. Not only does this direct your message via the shortest possible route, but it also reduces QRM.

The program also interfaces with popular weather stations such as those made by Davis and Peet Brothers, thus allowing for real-time weather data which is available at the touch of a key. The potential for this during a SKYWARN situation is obvious. You'll get wind speed and direction, temperature, rainfall amounts by the hour and 24-hour period and, in some cases, barometric readings. Such weather data can also be entered manually if a station has the information but not the hardware.

There is also a Direction-Finding mode which can be used by stations with either a beam or omni antenna! When the "fox" transmits, stations can call, by voice (on another frequency!) or keyboard their beam headings and/or signal strength. Using the antenna gain figures for these stations, circles are drawn on the map. The "fox" will usually be located where these circles converge. If you have one of the many "doppler" antenna systems it can also be used.

If DX-ing is your thing, there's also a "DX-mode" which also uses the UI protocol by simply monitoring the DX cluster frequency. As new spots are posted, they appear on the map with their callsign. Their location is based on the callsign prefix of the spot. Obviously, since you're not connected to the cluster, this isn't meant as a replacement to your normal AX.25 program, and you can't SEND messages, you can receive them (the program will flag yours and display them when asked.) It's just another tool for your county- or country-hunting efforts.

If, like me, you have a Global Positioning System (GPS) receiver with NMEA-0183 output this, too, can be utilized with amazing results! Your mobile or portable position can be regularly updated. Using such a "stand-alone tracker" you don't even need a computer. All you'd need is an H-T, TNC and GPS! Think about the possibilities for such a setup in something like a marathon, walkathon or even for someone shadowing an important official.

APRSDos was written to be able to run on just about any PC compatible computer from the latest Pentium Pro down to a lowly 8086. Heck, I know several people that use it with a Hewlett-Packard HP-200 palmtop! Maps are available from a large-scale map of the whole world to extremely detailed street-level maps. There's even a mail-reflector about it to which you can subscribe. It's lots of fun, has many potential ARES / RACES / SKYWARN uses and I'm sure you'll enjoy playing with it!

SOME REALLY SIMPLE BASIC INSTRUCTIONS ON GETTING APRS ON THE AIR NOW

If you don't use Windows, but have PKZIP204g, put the APRS disk into the floppy drive of your choice (I'll call it drive A) then expand the APRS files by using the following commands on the hard drive of choice:

```
     Make an appropriate directory     MD APRS
     Change to this directory          CD \APRS
     Switch to the A drive             A:
     Run PKUNZIP with directories      PKUNZIP -d APRS99z.zip C:
```

Don't forget to use that "-d" switch, which allows for the creation of those necessary subdirectories!

If you use WINZIP, change to drive A and double-click on APRS75.zip, click expand button, tell it where you want it and follow onscreen directions.

**************************** VERY IMPORTANT ****************************
IF YOU ARE USING A KANTRONICS TNC, OPEN THE FILE "INITTAPR.TNC" (it's in the "SYSTEM" folder) AND, USING ANY TEXT VIEWER, CHANGE THE LINE THAT SAYS "PAR 0" TO "PAR NONE". IF YOU DON'T DO THIS, YOUR TNC WON'T UNDERSTAND ANYTHING THE PROGRAM WILL TELL IT!!
****

Make sure your TNC is in Terminal or Command mode (whatever it's called by the manufacturer.) At the C:\> prompt, go to your chosen APRS folder and type "APRS99Z.exe". If you're using Windows, just double-click on that file and "maximize" it. This brings you to the LOGO screen. Enter your callsign. Tell it what kind of TNC you're using. Answer the other various questions. When you're done, the main map screen will appear.

Now press M(aplist) then C(hange), and tell it you want the appropriate maplist for your region. Use the arrows or mouse to bring the cursor to your approximate location (keep your eye on the upper left part of the screen which shows latitude/longitude of the cursor.) Then press HOME to center the screen on it. Use the PgDN key to zoom in a few screens and tweak the cursor to your EXACT QTH. You may have to zoom in to a very small scale to get the necessary resolution. Once the cursor is at the right spot hit the HOME key again.

Press I(nput) M(y) P(osition) and confirm your lat/long, choose a symbol for yourself, type in a brief comment, and verify it. Once you press that "Y" you're essentially ready to go on the air. In it's most basic form, you're configured! Tune the radio to 145.79, hook it up and see what you can see. It might take a few minutes for other stations to appear (assuming there are some) but if you get a little impatient, try pressing O(perations) Q(uery) and give it a radius such as 64 to force position reports from others.

Look for stations whose symbol is a green star. THESE ARE THE WIDE DIGIPEATERS! Is there one fairly close to you? If there is, press the "D" key. If an asterisk (*) appears next to a callsign (hopefully that nearby WIDE) then you're hearing it directly. Make a note of that nearby WIDE station's digipeater path.

Now you're going to set YOUR digipeater path. Press U(nproto). If you heard that WIDE station directly, enter it's call sign and ssid, if any. Follow this with a comma, then type in "WIDE". For example: "WA2JNF-4,WIDE" would be how I'd enter it here in The Bronx, but the nearest WIDE to YOU is what YOU'RE looking for.

Next you want to set your Power-Height-Gain figures. Press I(nput) P(ower) and tell it how many watts you're using, your antenna's height above AVERAGE terrain (look at a topographical map of your area,) the gain in dBd and the antenna's directional pattern in degrees or 0 (zero)for an omnidirectional antenna.

Finally, set your Beacon Text by pressing I(nput) M(y) S(tatus) and typing in a short comment different than the text you used for your Position Text earlier. At this point, you're about as far as you need to go for now.

I hope to see you all on my screen in the VERY near future. Look for me at cruise missile coordinates 4052.71N/07354.06W.

APRS: Using It

(or: Now that I've got it set up, how do I make it work for me?)
by Arte Booten N2ZRC

In previous articles I've described what The Automatic Position Reporting System is and how to get it set up on your computer and radio. So you're now probably telling yourself "OK, great. I've got these stations appearing on my screen. Now what do I do?"

One of the features in APRS is the ability to send what we call one-liners; that is, one-line messages from station to station either direct or by using digipeaters. >From the main APRS screen press S(end), and type the stations call and <cr>. Then type your message and another <cr>. You'll know when they got it when you receive an *ACK* which replaces the first five characters of your message. These one-liners are the only situation when APRS uses anything other than UI packets.

When you send a message in this manner it will be sent via the same digipeater path as your position and ID packets. If your intended recipient is someplace else you can STILL send it there by specifying any of a dozen alternate digipeater paths which the program can store for you. If you press O(perations)-D(igipath)-S(ave), you'll be prompted to enter a two letter code for that path via whatever path you choose, such as:

```
NJ VIA N2SF,WA2JNF-4,W2HOB
```

to get to Southern New Jersey from Westchester. To see the paths you've stored, press O(perations)-D(igipath)-L(ist). The prime purpose of these alternate paths is to keep the QRM to a minimum and to use the most direct and, sometimes, the only feasible path.

The weather systems feature of APRS allows you to see various weather information in real-time which is transmitted by stations with a Peet Bros. or Davis Weather Station. Depending on which version of APRS you're using (as of now, late December, it's 7.7e) and the options the weather station has, you can get different kinds of information including temperature, rainfall amounts (to the 1/100th inch) in the past hour and 24 hour periods, wind speed, direction and gusts and barometric pressure. By pressing W(eather), you'll see a list of options to choose from. These have changed (for the better) in the last few versions, so I can't be specific.

If at any time you wish to cease transmitting without actually shutting down the program, simply touch C(ommands) X(mit). This will disable the timer within APRS. You will still send out whatever the TNC itself is set to transmit at the predetermined periods. Press them again when you want to resume transmissions. When you want to send a specific packet (most often your position), you can do so by pressing X(mit) P(osition) [or B(eacon), M(essage), S(tatus), O(bject) or A(ll), as the case may be.]

In order to find a station on the screen, you can always use the O(perations)-F(ind) (what else!) command. If you'd like to see something really neat, try O(perations)-R(eplay) with a mobile station. You'll see the station's track being replayed. To access your TNC you'd use O(perations)-C(omms)-T(NC) which leads you to a very basic terminal screen. To get stations to appear on your screen faster (within two or three minutes) you'd use O(perations)-Q(uery), followed by a radius in miles from you.

Now that you've been on the air with APRS for a few hours, you don't necessarily want to wait for all those stations to reappear if, for some reason, you have to exit the program. No problem. Next time you fire it up, press F(iles)-L(oad), then type BACKUP.BK, or whatever you'd like to call it. Every time you shut APRS down it'll save a BACKUP.BK file, replacing the previous copy. Be aware, though, that all of those packets are timed, and any station in this backup that was heard more than two hours ago will "gray-out" (APRS considers them to be inactive and makes room for more stations that way.)

One thing to remember when playing APRS is that the best way to learn, as with anything else, is by doing. You can play with the commands as much as you want. You're not going to BREAK anything! About the worst thing that can happen is a lockup, and this is a rare thing. Usually the three-fingered-salute (Ctrl-Alt-Del) will get you out of it and you'll have to start over. So play with the thing. I mean, how do you think I learned about APRS, by reading about it?

Speaking of reading about it, yes I did. It's right there in the APRS distribution zip file. You can always read those files by pressing F1-F(iles) and typing in the name of the file you want to see. One suggestion: if you're a slow reader, press the down-arrow button once in a while as APRS seems to get impatient with you when it just sits there while you re-read that paragraph for the umpty-umph time and shoves you back into the program.

There are dozens of these readme files in the "README" folder. You can also see them (at your leisure and there for the printing) by using any old text editor. Many of the answers to your questions can be found there, sometimes buried deep and not quite as visible as you'd like.

I hope you enjoyed this series on APRS and hope to see you on the map in the near future. Whenever I see a new station on the screen I try to send them a one-liner welcoming them to APRS and offering live assistance and advice. Feel free to take advantage of this, or ask questions of any station on the air at that time. We're all very excited about this program and think that "the more, the merrier" is the way to go. We've gotten a lot of "converts" in the last few years and this situation can only improve, so come and join us on 145.790! 73

As with most of the stuff I've written about APRS, I place these in the Public Domain, free for the use of anybody. Post them on your APRS website. Print 'em up and distribute them at APRS demonstrations. Include them in distributions of AOL, errr, APRS disks. All I ask is that you give me credit for them. That's all.

Well, why can't we use a HSP with a weather station? I may be missing the point, but the data flow from a GPS and a WX station is not that much different. It sure would make wx reporting a lot more affordable to those stuck with single com port computers!

I am speaking of Dos APRS, by the way. I haven't got any idea if WinAPRS allows it on the HSP. I do know that Bob requires wx on its own port, though. Probably something to do with the dribbling nature of the serial data from the U-II WX unit.
Half the time, it can't even finish a sentence until the beginning of the next one. Maybe the U-2000 output is more reliable.

Of course I could be 180 degrees out of phase here, I'm sure Bob will set me straight.

Yes, the code will make maps from data files downloaded and expanded from the
USGS ftp site.  These files are sent using a "grz" compression format.  You
need to first download the GRZ software so that the downloaded files can be
expanded.  Be sure to download the "optional format" files.  Answer the
question about using the CD or ftp data correctly and you will be off and
running.

Ref conversion from nautical mile and degress of latitude
The reference or its interpretation is wrong.
 1 minute of latitude = 1 nautical mile
  0.01 minute of latitude = 60.8 ft approx

A minute of latitude is about one nautical mile at the equator, the poles and
in between to a good enough approximation unless you are trying to measure
continental drift or target ICBM's.

The conversion for longitude is a different story.  It depends of the
latitude. At the equator (lat=0 deg) 1 minute of longitude is 1 nautical mile.
 At any other
latitude it is cos( lat) nautical miles.

I have been using MFJ-86212 full time for APRS for about 2 months.
Transmit is fine, but the receiver, in my unit at least, seems poor.  I can
only hear a very local digi(Kenwood TH-215 HT has much better receive).
That's OK for my use, and would be fine for remote WX.  Very low
current-25ma in receive-is a plus.

I have 3. Two as digi's and one fer da mobile. NO PROLEMS! As a matter of
fact, I am going out today and purchasing a 4th for the QTH.

I've been using them for almost 2 years, without any problems what so ever.
By the way, they are all coupled with a KPC-3.

Good Luck.

But I enjoyed them! ;-)

Sure would be nice if the Mailing list defaulted to the Sender. Pretty
simple to fix. Admin needs to change the default "Reply-To:" field.

236. True DCD MUTE mod for Repeaters

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Tue, 10 Dec 1996 10:39:46 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.GSO.3.95.961210095606.28856E-100000@arctic>
Rendered body type: text/plain

I have modified Alan Crosswell's schematic with my guess as to how it
could work. Can anyone confirm or test this?

```
> The "true DCD" modification kit from TAPR just sits in between the FSK
> modem DCD output and the DCD input to the Z80.  In the Tiny-2 its Jumper
> JPD.  Here is what it looks like after installing DCD state machine and
> my two suggested ORing diodes and MUTE output.
>                                 D1
> external RFDCD  -----* 1  X----|<----+
>                                      |
>                      *---------------*-------> DCD in to Z80 I guess...
>                                      |
> TCM3105 DCD out ----+* 3             |      D2
>                     |                +------>|-------+-------> Mute out
>                     |                                |
>                     +--->DCD state machine input     |
>                          DCD out fm state machine>---+
>        > - - - ... ----->bunch of other places the state machine hooks
>                          to the TNC guts to actually look at the bit
>                          stream, obtain power, clock, etc.
>
```

Alan also said:

> It would be truly nice to only cause packet transmit holdoff when
> 145.79 is busy. Currently, ORing the two means that holdoff happens...
> both when packets are being received from mobiles on the repeater as well

```
> as when packets are being heard on 145.79.

**** But this should certainly not be a problem, because the ONLY thing it
is "holding off" are the packets being heard on the voice channel. and
waiting for a clear packet channel.  THere are no packets to hold off
during the occasionaly 0.2 second burst on the voice channel...

APRSdos REPLY/COMMENT:  I got 5 of the very early models....  THey all had
marginal receive sensitivity around 1 microvolt.  BUT OTHERS have said
that MFJ found a problem with the TR diode and have restored the design to
its original specs of a few tenths of a microvolt.  Can anyone confirm
this.  Mine are still a little deaf, because It will be forever till I go
climb the tower to get them back to send back for the mods...

Rendered body type: text/plain

I need some help getting my GP-22 GPS unit tied into my aprs setup.

I have APRS stup and running on a 486dx2-66 with my Ultimeter 2 feeding data just fine.

Now I have a HSP cable I bought from Kantronics, but no pinouts for the Icom GP-22. I have the interface kit that has the nmea port on it. WHat I need are the correct hookup for that port.

Any info would be helpfull.

242. Re: [APRSSIG:7111] APRS KPC-3 Icom GP-22

From: rwf@mindspring.com
Date: Tue, 10 Dec 1996 16:39:02 -0500
To: aprssig@tapr.org
Message-ID: <3.0.32.19961210163807.00759a74@mindspring.com>
Rendered body type: text/plain

All HSP adapter cables need power to run. Many laptops do not provide power on the same pin of the RS232 connector that the HSP is looking for it on. On my second HSP cable, I rewired it to get power from a pin on the KPC-3. PacComm's cable looks for power on a TNC pin as well as a pin on the PC, but sometimes even that one doesn't work at first. This is because TNCs, HSP cables and Laptops all vary between each other.

Start by finding out where the cable YOU have requires power. I have seen the AEA and PacComm, but not the Kantronics.   You can install a jumper in the KPC-3 that allows powering it from pin 25. If you fuse it properly, you can get power there to run the circuit in the cable. I doubt this is the way the standard Kantronics cable is built, though.

The early PacComm cables looked for power on pin 6 of the laptop. Later they added a power wire from the TNC, too. I think also on pin 6. I think it was an orange wire.

Good luck

I think your Tiny 2 and MFJ should take them just fine, as long as you have
enough memory.
The AEA's are in their own little world, as are Kantronics.

I didn't know about the dual aliases myself. I thought the TNC-2 close
solution was to use TheNet.

I think PacComm may have a chip either now or soon with LOTS of APRS
functionality. There was even talk of a real live APRS DIGI EPROM.

After 2 calls to Icom I was able to get the info I needed.
With the GP-22 in order to have the NMEA port you need the interface
unit. It gives you the NMEA port and the external ANT. jack.
I needed to know how the plug was wired on the interface unit.
Ends up it is just a 1/8th inch Mono plug Tip Positive Sleave Ground.
the HSP Cable I have from Kantronics had 3 wires for the GPS one
Positive one Negitive and an extra ground wire I didn't even hookup.
Worked great after I set the TNC's baudrate down to the 4800 and turned
HSP on in aprs.

OK, so they used a low-drop regulator, and when you reduce it to 5 volts, it
gets a bit unhappy. If you didn't smoke the regulator, it sounds like even
that was pretty well designed.

Hello,

The chip is a Maxium DC to DC converter that outputs 3.3 volts.  It looks
like about 2 diode drops so 5 volts is 3.6 for
chip input.  I do not remember what the minimum voltage to the thing is.

If you calculate the power input at 6 volts it is 0.588 watts and at 5 it
is 0.6 watts so it does not look too bad.

I wonder what the current drain at 7.2 volts is?  If it is about 81 mA
then it may be slightly better to go with a 7.2 volt
Nicad pack.

```
I've been spending my "spare" moments writing a Windows 3.1 program to
interface to my U2000 and APRS.  It's main purpose is to report weather data
in more detail than APRS does for my home station including some showing
some graphs.  I still wanted to be able to post my data to the APRS network
so it does that, too.  Meanwhile, I'm learning a bit more about Windows and
C++ (been programming C for many, many moons!).

I've just uploaded it to tapr's ftp area in software_lib/upload and it will
hopefully migrate to software_lib/weather.  There are still several things
on my to-do list, but I thought there might be others who would be
interested in trying it.  I'm most proud of it's plug-n-play ability - it
finds the weather port and TNC port and figures out your callsign, unproto
path, and lat/long by itself (assuming you've been using APRS recently).

Let me know if you try it.

Hey Tony, I'm VERY interested if it might also accept Ultimeter II data
(I don't know the data differences). I've been running a separate laptop
for
years on my WX line just so I can see the last 20 hour graphs, and still
run
APRS on my "big" computer. I'd LOVE to run APRS and collect WX data
24hrs per
day on one computer.

Thanks 4 your efforts,

254. APRS in NWS Offices....

From: Jim Duncan <ku0g@sprynet.com>
Date: Tue, 10 Dec 1996 20:50:10 -0800
To: aprssig@tapr.org
Message-ID: <199612110450.UAA06362@m1.sprynet.com>
Rendered body type: text/plain

```
The Kansas City APRS Working Group is attempting to get an APRS station
going at the National Weather Service office (NEXRAD site) here.  The area
Skywarn Coordinator, Dennis Carpenter (KA0SXY), has requested that I provide
him with information on what other NWS sites are doing with APRS in
conjunction with Skywarn activities and so forth.

Would you kindly EMail Mr. Carpenter DIRECT and CC the message(s) to me with
all of the information that you are able to provide on your experience(s)
with APRS in the local weather service offices.

We are particularly looking for the following information:

1)  How does APRS fit in to your overall Skywarn network?

2)  What unique benefits has the installation of an APRS position with your
local WSO presented with regard to Skywarn and other weather operations?

3)  What equipment you are using...

4)  Where you are located...

5)  Number of remote WX sensing sites (i.e. Ultimeters, Davis Bros., etc.)
that are within the service area of your WSO as well as your area APRS network.

6)  Number of spotters using APRS to aid in tracking of severe weather
events, mobile location, etc. along with the number of stations using full
laptop mobile/GPS, stand-alone tracker or MIC-E modules.

7)  Did the NWS provide your station equipment or what were the sources of
the APRS equipment at your NWS site?

8)  Any other pertinent, useful information that you can pass along to Mr.
Carpenter that will assist him in making a commitment to posting an APRS
station in our WSO and in planning for the on-air operations.

Thank you for your assistance and we appreciate your efforts!  Please
respond as soon as absolutely possible!!

Rendered body type: text/plain

```
Has anyone had any success with an U-II and a KPC-3 as a stand alone WX
station?  Yes, I have read the APRS help files and (believe it or not) the
KPC-3 manuals!  I set the GPSHEAD parameter to "*",but the TNC doesn't
store the string from the U-II in the LT buffer. The baud rates also match
at 2400, the LPT and BLT parameters are set.  It will beacon a test msg
stored in LT buffer 2.  Any ideas, anyone?
Thanks,
Gary Wells, N3HCP

257. Help with Pico Packet GPS

From: schiers@ames.net
Date: Wed, 11 Dec 96 07:49:56 -0600
To: aprssig@tapr.org
Message-ID: <199612111352.HAA21163@brain.ames.net>
Rendered body type: text/plain

Like a dummy, I misplaced my manual. My PICO has dropped out of GPS mode while in the car in stand alone mode. I can't recall the command to put it back into gps mode.

Also, if you could pass along the other gps settings like sentence, etc for the PICO...I know that manual is around somewhere, but I want to get my mobile setup back on the air.

Can't figure out why it dropped out of gps mode just sitting there, but it has happened before. Wonder if it is a firmware problem?

Rendered body type: text/plain

The thing I screwed up on mine was not using the WX symbol " _ " in the Position statement.

Aside from that, I just set the header to match (I think it was *). Some versions of the U-II used a # for the beginning string.

Did you make sure to use a null modem cable (swap pins 2 and 3). The U-II cable will not work directly into the KPC-3.

Good Luck

WinAPRS will have weather graphs built in shortly, these already exist in
MacAPRS but we have not gotten the graphs ported to Windows yet.

I had the EXACT same problem---until I realized that my 25-pin connector
was
wired wrong and WX data was not getting into the KPC-3. Seems like the
input
```

is an odd pin number---try pin 2 or pin 3 (I think)...

Either a DC-DC converter or some types of low dropout regulators can
have this type of behavior. Those two data points alone are not
sufficient to be sure which type of regulator it has.

268. Garmin GPS20 Problem

From: Chan Siu Kwing Albert <askchan@HK.Super.NET>
Date: Thu, 12 Dec 1996 01:18:17 +0800
To: aprssig@tapr.org
Message-ID: <32AEECD6.6474@hk.super.net>
Rendered body type: text/plain

```
Hello everybody!
I live on a compartment type building in Hong Kong and I had bought a
GPS 20 from TAPR. Only one side of my flat open to air and here I setup
a Maldol HDX-30 wide band antenna (100Mhz - 1500Mhz) to the GPS 20. I
had tried both the GPSy and MacAPRS GPS related program. I get nothing
from the GPSy and I saw that the percentage good box increased at the
heads up dispaly from the MacAPRS at the first time. But after that I
got nothing change again. I had tried the programs many times and at
```

different time slot. I make sure that both the program receive data from
the GPS. Below is some data collected from a NMEA log:

```
$GPRMC,165546,V,,,,,,,111296,,*38
$GPGGA,165546,,,,,0,00,,,M,,M,,*63
$GPGSA,A,1,,,,,,,,,,,,,,,,*1E
$GPGSV,1,1,01,03,00,000,,,,,,,,,,,,,*4B
$PGRME,,,,,,*4D
$GPVTG,,T,,M,,N,,K*4E
```

Only the time field changes all the time. Does the GPS 20 have problem
or I collect no data from the air under my testing condition?

269. Software for APRS and Weather

From: Don Hilman <hilman@camosun.bc.ca>
Date: Wed, 11 Dec 1996 21:17:46 -0800
To: aprssig@tapr.org
Message-ID: <32AF957A.3954@camosun.bc.ca>
Rendered body type: text/plain

Have read several recent messages from individuals doing various
interfaces to APRS. I am an instructor of computer Science and sponsor
our College Station VE7CCD . We have underatken to write a variety of
APRS interface code as part of an interfacing course I teach. This
quarter just finshing we have created a few useful tools for sig members
and when I learn how to properly post them I will FTP them to the site.

The code so far ,(and source will be included) is as follows:

A general NMEA 0183 test program for Win95..written in C++
This program allows you to view raw data from any NMEA 0183   device for
testing purposes.

A Davis instruments interface to most any other O/S..reads Davis data
and re formats it for display in a variety of GUI's. So far the GUI
support includes WIn95 and QNX (Photon).

Programs still being worked on but will conclude in the Spring include
a JAVA based display for wind instrument data. The APRS piece is still
being written.

Real time Internet posting of aprs data using a more detailed map
overlay (in color) from a Cnandian digital chart family. Weather
intsrument interfaces will also be included and are expected to support
the Ultimenter and Davis as a start. Various incarnations of this
software will be posted on our WEB site after Christmas break. I will
post the URL after the site has been tested.

Merry Christmas to all

VE7FBI

All software is caveat emptor as it is student code but is of quite
good quality in my opinion and represents a great place to start for
SIG members intersted in software but are having a difficult time
getting off the mark.

Message-ID: <199612111723.RAA06236@tgis.co.uk>
Rendered body type: text/plain

Hi,
I saw a couple of messages on the sig recently about using "digest"
mode on
TAPR . I am using Win95 Internet Mail program, trouble was the
"find" facility would only search the message that was currently on
display (Eudora didn't have this restriction) . However, if you opt
for "digest" on the sig you receive one long bulletin that contains
the listing and then the message contents, if you now use the "find"
facility the program will search the current "digest" for any keyword
. Very usefull if you need to refer to someone or something but can't
recall where it was you saw it. Not sure how big the digest gets
before it splits into parts though.

Actually, what this is about is DCE vs DTE, sort of the electical
equivalent of male and female connectors. Both the U-II and KPC are DCE
(Data Communications Equipment). Normally a DCE is attached to a DTE
(Data Terminal Equipment) like a computer. To connect two DCE's you need
to use a null modem cable, which flips pins 2 and 3. Using a regular
RS-232 cable connects the two inputs to each other, and the two outputs
together, so nothing works.

Null modem cables flip several other lines as well, but for this
application you only need to connect pin 3 on the U-II cable to pin 2 on
the TNC, and of course signal ground, pin 7 on each.

Radio Shack sells a null modem adapter you can use with a regular cable,
or you can buy a null modem cable, or wire your own.

Steve K4HG

>From what you have stated, you have two potential problems that will
inhibit satellite acquisition. First, you need to get an antenna designed
specifically for GPS.  I am not familiar with your wideband antenna, but
it does not have the gain required for GPS. The GPS signal is at 1575
MHz and is circularly polarized. You can make a simple 1/4 wave
antenna that is 4.8 cm long. This type of antenna would have 3 dB
polarization loss, but would be far better that your wideband antenna.

The second problem is your view of the sky. If you do have building
obstructions, try placing the antenna on the south side of the building is
possible. At your location, the worst satellite coverage is to the north.

Terry, KI0BF

I've had so many requests for my proceedure to get Street Atlas 4 loaded
and running on my laptop with 80mb drive that I've decided to post it
here. This is very much a work in progress and any further input would
be appreciated. Please understand that the purpose of this is to get one
program , Street ATLAS 4 with GPS, running on a laptop that is available
because no longer is usefull with the current generation of software. At
one time I had a list of the files that Win 3.0 required but it is out
of date. I've been unable to get a similar list for W3.1X or for the 32
bit extensions.

The attached file lists the current settup. I would imagine that this
would also be usefull for WINAPRS to allow space for more files.

A note of caution ! If you experiment move the files you want to remove
to a temporary directory first and then reload Windows and test your
software. Good Luck @ 73  Joe WK0G

Rendered body type: text/plain

If you "listen" to packet as I do (I just gotta hear those little beeps to know what is REALLY going on on the channel)... THen you may be noticing a station comming on occassionally in the afternoon to midnight time frame that seems to be chirping a lot of very brief packets.

Well, that is MIR who is now on our APRS frequency (145.803 at start of pass and 145.797 near end of pass). Of course it doesnt bother APRS because the signals are far weaker than our terrestrial net, BUT if you simply tune up 10 KHz to the middle of the passband, then you may see a few DX grid square stations! I saw 2 yesterday in New England.

THe very brief packets you hear are of course REJ-BUSY packets to all of the stations trying to connect to MIR (a useless exercise since only one station in the world can be connected at a time)... The longer packets may be someone reading the BBS (very rare due to all the QRM) or, an occassional UI BEACON from someone.

Anyway, since they are on our frequency now, you might find it entertaining to watch. OF COURSE, I DO NOT ENCOURAGE the use of APRS via MIR, but if you are so compelled to send a UI frame via R0MIR, then you may as well make it very brief and may as well put something useful in it like a 6 digit grid square... (alt-SETUP-FORMATS-SPACE)

Subject: Re: [APRSSIG:3049] Ultimeter II and KPC-3
Message-Id: <63960716224736/0004818186NA3EM@MCIMAIL.COM>

Connecting the Ultimeter 2000 (if that is the same as the II)
is straight forward:

Pin #3 from the Ultimeter is Data Out
Pin #5 from the Ultimeter is Ground

Pin #3 from the Ultimeter goes to Pin #2 of the KPC-3
Pin #5 from the Ultimeter goes to Pin #7 of the KPC-3

Set the TNC as follows:

GPSHEAD 1 !!      /* This is the string that the Utimeter sends out /*
LTP 1 APRS WIDE   /* This is your path for the transmitted information
/*
BLT 1 every 00:05:00 /* Sets timer 1 for every 5 minutes /*
LT 1  /* will have the Information from the Ultimeter /*
INT GPS  /* Put the TNC into GPS Mode Turn it off and then ON /*

It will work unattended and without a PC connected to it or
without the APRS software.  We have several in Miami that are
set up this way for automatic Wx reporting to the National
Hurricane Center.

APRSdos REPLY/COMMENT:  I doubt it is $LCGLL which would be from a
LORAN-C; but more like a $GPGLL which is from a GPS unit.  Anyway, doesnt
matter, APRS ignores the "sending" device nomenclature.

295. APRS/Skywarn info @ NEXRAD sites

From: "John W.(Bill) Hays - w0omv" <billh@netins.net>
Date: Thu, 12 Dec 1996 22:43:05 +0000
To: srstech@kcnet.com
Cc: ku0g@kcaprs.com, aprssig@tapr.org
Message-ID: <32B08A79.5B17@netins.net>
Rendered body type: text/plain

We are particularly looking for the following information:

1) How does APRS fit in to your overall Skywarn network?

We use voice FM repeaters to exchange WX info to/from the NWS site as our primary means of info exchange, at least for now. The secondary means used, because we do not have very many stations on the air yet, is APRS.

2) What unique benefits has the installation of an APRS position with your local WSO presented with regard to Skywarn and other weather operations?

It allows for dissemination of both the nature of the WX and its position info to be sent from the NWS office and also to be recieved in a visual format. Later when more hams have voice and GPS equipment installed in their spotter vehicles it will provide a very rapid accurate, return of position and type of WX info to the NWS and simultaneously to other APRS equipped stations.

3) What equipment you are using...

The local club furnished two radios, one for voice and one for APRS, a power supply, and two verticle antennas mounted on a tower furnished by the NWS that we share space on. We use our HT's to hit a local repeater so we monitor at least two voice VHF frequencies and APRS. A 386 (I believe, using LINUX OS for the display and routing of AFOS auto WX data) computer provided by the NWS on our operating desk together with a 486 box at the second ops desk we share space at.

4) Where you are located...

We are provided two operating desks in the main NEXRAD building. One for our sole use that is in the NEXRAD operations room but out of their way and the second in an adjacent partioned cubby-hole that we share with regular WX admin. and/or research function use.

5) Number of remote WX sensing sites (i.e. Ultimeters, Davis Bros., etc.) that are within the service area of your WSO as well as your area APRS network.
We only have three 24 hour sites and two additional part time sites at present.

6) Number of spotters using APRS to aid in tracking of severe weather events, mobile location, etc. along with the number of stations using full laptop mobile/GPS, stand-alone tracker or MIC-E modules.

So far, just two laptop/GPS stations.

7) Did the NWS provide your station equipment or what were the sources of the APRS equipment at your NWS site?

The NWS provided two CPU's. A 386 CPU and monitor full time and we share the use of a 486 box running Windows 95. The NWS (I suspect the Meteorologist In Charge and perhaps one or more of the employees) paid or offered to pay for the WinAPRS software registration. Mark and Keith when asked about method of payment provided a registration number free of charge to the NWS at our site. The local club had earlier purchased a copy of the regular APRS program for use by the club remote U-II site/s.
The 386 box has LINUX installed by Ron Luse, KD9KX. He has it set up to act as a router to extract certain WX products from the AFOS system, route it to the monitor at our main voice ops desk and also to the 486 box running WinAPRS thence to the TNC and out on 145.79 Mhz.

8) Any other pertinent, useful information that you can pass along to Mr. Carpenter that will assist him in making a commitment to posting an APRS station in our WSO and in planning for the on-air operations.

The only drawback to the automatic WX products on 145.79 Mhz is that a few of the APRS stations are using the DOS version.
When the auto WX is sent it appears at the bottom of the screen then the 2nd line of auto WX appears below the 1st and pushes the 1st line up which blanks out the bottom approx 1/4 inch of the map. Each succeeding line pushes/scrolls the text data up obscuring more of the map until eventually there is no map visible.. This can be eliminated by hitting the space bar and forcing a redraw of the map. Of course the minute the next auto WX data is sent the screen begins to be blanked out again.
WinAPRS and MacAPRS are not negatively affected this way.
Ron is working on a solution.
It takes a little more training to use APRS and or WinAPRS than the voice system. I'd recommend having at least two ops one for voice and one for APRS. But I've seen situations when four operators could have been used. They all would have been busy!!

--
Bill Hays - w0omv email:billh@netins.net
I am located in Davenport, Iowa and work with the NWS with QTH
at the Davenport airport. I think the site is "DVN" in WX service
parlay. Don't know what the new 4 character ID is yet.
Hope this is of some help.

> I built it on a piece of Radio Shack 276-150 ($1.19) Multipurpose PC Board that I cut out with an old pair of dikes.
>
> Theory: J1 is a female 5.5 x 2.1 mm jack with a built-in switch. I installed it in the side of my Tripmate on the cord end. (I also glued a pair of Radio Shack 64-1877 magnets on the bottom of the Tripmate, with electrical tape on the bottom to protect my car--keep those bad boys away from your floppies and your laptop!) The switch is on the sleeve side, not the pin side, so I used it to interrupt the negative (black lead) side of the battery, since I didn't want the alkaline batteries to see the output of U1 for extended periods. When the mating plug is plugged in all the way, the connection between J1-2 and J1-3 is broken. The center of the plug mates with J1-1 (positive); the sleeve with J1-3 (negative). The wall wart (e.g. Radio Shack 273-1455) or cigarette lighter adapter (e.g. Radio Shack 270-1533) supplies +VDC on the inside contact and -VDC on the outside contact.
>
> CR1 and CR4 are transient absorbing zener diodes. Their function is to provide spike protection to U1 and to the Tripmate respectively. CR1 limits the DC input range to less than about 15 VDC. CR4 cuts in at about 6.4 to 7.1 VDC in case anything makes it past CR1 and thru U1. Someone else commented they thought 8V would be about as high as you'd want to go on the Tripmate Rockwell board.
>
> C1 is an input filter for U1 (pin 1). The voltage rating of 50V is conservative given the presence of CR1, but automobile power is so bad, why not. C2 is there to clean things up a little bit on the output of U1 (pin 3). U1 seems tame with it on the other side of CR3. I wish I'd put in a good ceramic high-frequency cap as well, but I cut a corner on that one.
>
> I also wish I'd had room for a filter inductor on the input of U1. You can add it if you're even more leery of automobile power than I am.
>
> CR3 is there because I decided I didn't want the battey pack supplying voltage to the output of U1 when the external power is disconnected, and CR2 is there to compensate for the voltage drop of CR3 by providing the same drop on the ground lead of U1 (pin 2). This may seem kind of hokey, but it seems to work OK.
>
> I tested it with the wall wart and with my Honda Accord (about two hours of driving). It didn't smoke, heck, it didn't even get warm. And it didn't fry my Tripmate. And with the magnet mount, it stays on the car at 65 mph. (But it's not completely waterproof...yet.)
>
> I'd suggest fusing the cigarette lighter adapter with a 0.5A fuse, just in case.
>
> Comments welcome, as long as they're constructive. Sorry, no construction help--this is for the folks who have already burned their fingers a few times.

I've been following the mail about the tripmate and I am wondering if it
is possible to modify it to use an external antenna.  I don't quite like
the idea of setting it on the dashboard for several reasons, especially
because of its bright color.  Please, I would like to find out before I
go out and purchase one.

                                Thanks, Anthony AB5QR

Hello,

Basically you need to dig the unit out of the box, disconnect
the patch antenna, and rig up a connector.

The problem is that there is no voltage supply for a preamp.  There
is the network for it, but from the material on the chip set I read the
power is feed thru the chip.  I am not sure if I could get enough
information on how to modify it to feed in preamp power.
Given that unimplemented features like 1 PPS is just a tiny pin
on a surface mount chip I bet the Preamp supply is the same
way.

I finally got the Zodiac (Tripmate) serial I/O docs.  One
interesting note is that GPQ is a valid NMEA command.  GPQ
queries for a sentence.  You can turn off all the messages
and just send $IIGPQ,RMC<cr><lf> if you want a RMC
message.  I noticed if you send a query for a sentence
that is not valid (like GSV if not navigating) it will not
send a reply.

What is strange is that it is mentioned in the begining of
the docs but it is not listed as an input command and
does not have a details page.

The other interesting thing of note is before the unit is
navigating but has a valid time it will include satellites
below the horizon in the search. The manual notes
that in the elevation field of the GSV message satellites
below the horizon have a null field (,,) because the
NMEA spec does not mention that negative numbers
could be used there.  The tripmate.exe program on the
```

SA 4.0 CD puts these satellites at the horizon circle. I
would have preferred outside the horizon circle.

I just bought an MFJ 30 meter transceiver ($189) for experimenting with low power APRS on 10.151 and will add a RAMSEY 20 Watt PA ($49 kit).

Will let you know results. Initial impression is good. (5 minutes out of box and not connected to 30m ant yet).

On random wire, there is quite noticible bleed through of a SW station into the 6MHz IF.. and it doesnt tune to 10.151. Will tweak that tomorrow.... ANyone else have one of these?

The tripmate is mounted in a plastic enclosure, looks somewhat weather resistant, which opens easily to change the batteries. Three interior screws sealed with nail polish to void warrantee reveal the gps board mounted in an rf shield. The antenna is mounted to the top of the shield, I think with double sided tape. The antenna connects to the patch antenna with a soldered connection.

I _think_ it would be possible to remove the antenna and wire some sort of connector to the case for an external antenna. I have not checked to see if any voltage for a preamp is supplied on the antenna connection. If not the antenna options would be pretty limited. In any case, it would be pretty major surgery....

306. Help wiring up my Kantronics 9612. Kenwood TM733a for one radio operation

From: james-m@ix.netcom.com (Don Murray AE4BR)
Date: Fri, 13 Dec 1996 04:22:16 -0800

To: aprssig@tapr.org
Message-ID: <199612131222.EAA18938@dfw-ix6.ix.netcom.com>
Rendered body type: text/plain

```
Hello and thanks for reading this..

I am in need of help setting up my Kantronics 9612, and TM733a for one radio
operation.  I am not even sure if this is possible.  What I would like to do is
wire the radio and TNC so that I can get both 1200 and 9600 baud operation on
the single 733.

I would also appreaciate if if someone could confirm my wiring by posting the
output pin assignment for the TM733 in regards to the 9600 baud port of the
9612 and the 1200 port of the 9612.

Anyone else handling both ports thru one radio?? Is it even possible.  The 9612
has a "oneradio" setting.  But the manual doesn't go into detail about it.

Any and all help will be greatly appreciated

Bob, be sure to give us a full report...I have my Kenwood TS-870s tied up,
and while that is fine during the day when I'm not there, the rest of the
time it is a "bit" much, don't you think? I would be willing to keep my
MOSFet amp on and I'm sure the 20w would drive it to a nice solid 250w
out, which I believe is the legal limit on 30m. 73,

Rendered body type: text/plain

```
To all,

Apologies for posting a mundane request for help - I do not know who
else to ask.

I am using a PK-12 with WINAPRS117 and find that if I power off the PC
and leave the TNC and radio up, when I come back, I am unable to
communicate with the TNC.  I finally had to disconnect the internal battery
in the TNC and completely reset it last night to get back in.  I'd like to be
able to leave my station up without the PC and my PK-12 manual says that
I can do this.  I tried the triple control C from the TNC window incase it
was in host mode, but no effect.  Any suggestions will be greatly
appreciated.

To: aprssig@tapr.org
Message-ID: <199612131418.IAA24893@brain.ames.net>
Rendered body type: text/plain

Now that it appears that AEA is going into the bit bucket, what would the two major software authors, (Bob and Mark/Keith), suggest as a replacement for the DSP2232.

Is there a non-AEA TNC out there that will do dual port simultaneous and run in the gateway mode AND be compatible with WinAPRS specificially and possibly dosAPRS?

Well Jim, in one of my messages I did write that I never left the sig and have been reading all postings right along. I just haven't been so vocal Hi as i was before. Also since I invested in a Tripmate I feel this is a good place to discuss it also. On the topic of Tripmate wouldn't it be great if APRS could be interfaced to SA4 what a setup that would be. I realy love Tripmate so much I bought a brandnew 130Mhz laptop to run it on.

Why would anyone want a external antenna for the Tripmate, If so why not just glue some magnets on the bottom of the receiver and place it on top of the vehicle it looks like it's water tight. Personally with what testing I have done with the receiver on the dash works just great in fact much better then my Magellan ever did.

I use a PK-12 with dosAPRS and don't have this problem. It probably has to do with flow control. Make sure flow control is turned off. When the PC is down, the PK-12 will still spew packets out the serial port. It might be hung waiting for an XON or something.....

WinAPRS does not put the TNC into HOST mode, HOST mode is a special mode
that AEA has for communication with their software.  If you were running
something like PC-PACRAT that puts it into host mode, then you normally
have to use that same software to take it OUT of host mode.

Mark

Message-ID: <s2b132b5.065@smtpgate.read.tasc.com>
Rendered body type: text/plain

```
Thanks Mark,

This was actually a situation where I was in WinAPRS, gracefully exited
the program and turned the PC off.  When I came back later, I could not
```

get back intothe TNC using WinAPRS (or anything else for that matter).
So I do not think that it was put into host mode, unless WINAPRS did it
when I exited, or the power off transients did it.

Perhaps Alan Edmonds suggestion about flow control will solve the
problem, what do you think? Would I turn flow control off from the
terminal window before I exit WinAPRS? How do I get it turned back on
when I re-enter WinAPRS?

On message length; someone told me that DOS APRS is 64 characters
and WInAPRS in 53. I have found that if I use the whole text window in
WinAPRS, it gets cut off.

Thanks for your help.

73,

John S. Seybold

>....

Isn't it just the case of capacitively coupling the antenna feedline
to the GPS and putting some DC on it?

```
---| |---+------> coax toward remote antennna
         |
         +--- +V
```

Presumably, if you're going to this much trouble to void your warranty
you've already added an external power source...

Don't flame me too hard if I am off base here. I do admit being
weeded out of EE very early (Omar Wing's Circuits class) and going
into CS:-) EE's know what CS really stands for.

Hello,

No voltage is supplied to the antenna connection. It does look
like at least the output side components are there. The problem
is where to fed the power into to come out on the output side as
I think preamp power is fed through the RF chip.

I do not consider the Tripmate to be water tight. Water resistant maybe. I
am running on external power and am not using the batteries, so I plan on
replacing the bottom half of the case with a flat plate and magnet and
SEALING the unit. This will give the unit a lower profile and make it stay
in place better. It does work very well on the dash in my van. I leave mine
on the dash and powered all the time, so it is soon to get a less noticable
color. The yellow has to go! Be sure to use a NON-metallic paint if you do
this! If you aren't sure of your paint, spray a peice of plastic or whatever
and watch your signal strength as you hold it over the GPS.

320. Great APRS HF for $189!

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Fri, 13 Dec 1996 11:27:57 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.GSO.3.95.961213104508.15652B-100000@arctic>
Rendered body type: text/plain

```
Ordered MFJ 30m HF transceiver Monday, got it Thurs (regular UPS) and
bench tested it today. I'm still very happy!  Looks like it will make a
GREAT APRS HF packet rig:

  VFO - 10.100-150 (actual 10.098-155) (worst case dial error abt 2.5Khz)
  BFO - Factory set to 780 Hz.  Screwdriver adj for 2125 HZ packet
  IF  - 6 MHz.  490 Hz (3dB) passband!
                570 Hz (6dB) Couldn't measure lower due to AGC
                             VERY NARROW 4 pole XTAL ladder filter
                             Specs claim 750 Hz (probably 60dB pts)
  RIT - 900Hz measured.  1500 Hz claimed
  SENS- 2 uv for 20 dB SNR  (estimated.  Sine wave looked 90% perfect)

Receive Current - 50 ma   (50 hours on a set of AA's!)

It is important to note that this is a true SSB Hetrodyne transceiver with
6 MHz IF and CW width XTAL filters (4 MHz VFO).  Considering the QRM on HF
packet (not necessarily on 10.151 which is clean) this narrow filter is
like an 8 dB improvement in noise performnce and even better in the
presence of QRM.  Remember, most of us run VOICE SSB radios with a 2.7 KHz
filter even though packet is only 400 HZ wide.  Even if you switch in the
CW filter on most rigs, they are fixed at 750 Hz and cannot be used for
packet at 2125 Hz.

TRANSMITTER:  > 4 Watts at 13.8v  untested
                1 amp at 13.8  untested

NOTE:  To transmit packet, you will need to take the TXD data from your
modem disconnect header in your TNC and run it to a varactor diode to FSK
this CW transmitter.  I will work up the mods to change the RIT circuit
into a XMTR FSK circuit.  WIll report more then...

But so far I am very impressed for $189 (wired and tested)
... (YOUR MILAGE MAY VARY!)  Remember, I still havent hooked it up for
packet nor begun the XMT mods...

DISADVANTAGES:
   QRP 4 watts.  I plan to add the Ramsey 20 Watt amp ($49 Kit)
   VFO freq drift expect to be a problem when human not present
   XMT FSK mods required (probably just a pot and connectors)
   IF  feedthrough (I could hear a 6MHz SW station bleeding through theIF)
```

but couldnt test the isolation because my sig gen only goes >10 MHz

If all you want to do is operate an HF gate, then only using the RECEIVER
is perfect, rather than having your $1000 HF rig at risk during lightening
storms etc...

PROJECTS FOR SOMEONE:

Replacing the VFO cap (which is simply connected to an NE602 chip) with an
XTAL circuit for 10.151 should improve any freq drift.

FSK mods

PA mods

Hey this is fun. I wouldnt touch my $1200 HF rig, but this is a tweakers
delight. This takes me back to the good ole days of modifying equipment
for fun and perfection...

OBJECTIVE: A 25 watt HF mobile rig for APRS.

Check out kantronics.com when you get some time. I think they have what
you are looking for. I have never used an AEA, so can not advise you on
features specific. However, the Kantronics line is a fine TNC, and they
have EXCELLANT TECH SUPPORT!

APRSdos REPLY/COMMENT:  I just updated my DOCS yestdy to reduce the
optional Delorme interface from $39 to $9. (I never sold any anyway,hihi)

What this does, is allow you to run APRS on an old PC as a communications
front end to Delorme or any other software that accepts a NMEA input.
What APRS does is to output via its 2nd serial port, NEMA data for any
object on your APRS MAP.  Of course no callsign or symbol characters will
cross the interface, but you will see a dot or posit on the other maping
software wherever there is an APRS posit.

To select which opbject is sent over to the other Maping Program conputer,
use any of the APRS methods for selecting (hooking) objects:

     Mover cursor and hit ENTER
     +/- keys to scan entire P-List
     <>  Keys to scan only Stns/Object on the current display
     N   Key for next WX station
     TRACK - By marking a station on the P-LIST for tracking, then
             EVERY new posit from that station will be passsed over
             the serial port to the other PC...

Since no one has ever bought this interface, caveat emptor.  But if any of
the above does not work, then I will fix it in the next version, hi hi...

324. prototype APRS node (on Linux)

From: Alan Crosswell <alan@watsun.cc.columbia.edu>
Date: Fri, 13 Dec 96 11:55:37 EST
To: aprssig@tapr.org
Cc: n2amp@weca.org, n2fmc@weca.org, n2sf@weca.org, wb2vvs@weca.org
Message-ID: <CMM.0.90.4.850496137.alan@manila.cc.columbia.edu>
Rendered body type: text/plain

```
Hello,

N2YGK-8 in FN31cd is running a prototype APRS node that does conventional
digipeating as well as SSID-based digipeating.  The flood (WIDE-N) mode
will be added to it hopefully this weekend.  If you happen to have a MIC-E
or would just like to simulate it and can reach my station direct (that
means KD1DU, N2SF, N2FMC, and N2AMP if you drive up here again;-) give it a
shot.  If any of the rest of you are APRS mobile in Westchester
County,  I should hear you direct in the vicinity of Briarcliff Manor
on the Taconic State Parkway, which is in the same valley as my house:-(

N2YGK-8 is listening on 145.79 for SSID to-addresses of APRS and VOX
(I think) as well as the usual RELAY alias for conventional stuff and
will repeat this out with an unproto path of WIDE-n for SSID's below 8
and with various directional paths for SSID's above 7 as described in
the MIC-E.TXT.  It will only respond to SSID-based packets if the digi
list is *empty* as that is the whole point of SSID routing!

To simulate a MIC-E, set your UNPROTO path to APRS-n (*no* VIA), where
n is 1 thru 7 for WIDE-1 thru WIDE-7 flooding (but no other digis in the
area implement flooding so it won't get you anywhere).
Use 8 thru 15 for N, S, E, W, N+wide, S+wide, E+wide, W+wide paths.

The directional paths I've set up are:

N: KD1DU-15 WA1LOU-15 (sorry, but that's as due north as I can get!)
S: N2SF WA2JNF-4
E: KD1DU-15 KD1LY
W: KD1DU-15 N2MH-15

I'll make the code available shortly.  It only runs on a Linux system.
Not exactly something to colocate with a repeater, but a good way to
try out some ideas.
/a

I cannot for the life of me understand why anyone would want to add an
external antenna to the tripmate and add the complexity of RF cables,
connectors, DC biasing, and and an external antenna.  And then being
limited to RF cable length etc.

The tripmate sounds like it is an ideal package with GPS and antenna all
in one and you can have an infinitly long DC/DATA cable to it.  Just stick
it on the roof or wherever you would normally plan on putting the antenna!

If it is not WX proof, then solve that with some epoxy.  If you dont like
the color, paint it.  I havent seen one, so these statements may come back
to haunt me as a fool, but The BEST GPS units for APRS are all-in-ones
where there is NO RF cable and you can put it ANYWHERE you can string a
small DC/DATA cable...

As hard as it is for you to realize, some people have different needs
than you do. For example, I work in a high crime inner city area. Leaving
anything in plain view invites theft. That means to use the Tripmate as
part of a tracker, I'd need to set the thing up every time I drive. What
I want is to have an antenna mounted in my convertible top and have the
whole thing auto-power up when I turn on the ignition. The Tripmate is a
great GPS for little money, and I would like to use it with an external
antenna. I was sharing what I had learned on the subject with others who
had similar plans to mine. Is this OK with you, or do we need to do it
your way or not at all?

This is a hoax.  We had a notice at NASA about this last week.

Plus the FCC has nothing to do with investigating such things.

More info at following site:

Went to lunch, came back and rig had drifted 90 Hz. That is typical of
some of the better analog VFO's (100 Hz per hour) but not good enough for
packet without operator interaction. Ill need to get a XTAL to replace
the VFO for hands off under-the-seat operation.

Subject: [WUN] AF GPS in E-Mail?

This month's MILITARY & AEROSPACE ELECTRONICS reports that the AF will equip
all C-5, C-141 and KC-10 aircraft with GPS data transmission capability that
will append such "information to all cockpit E-mail messages. This will give
Air Force Air Mobility Command the ability to locate airlift and refueling
craft and get instant crew and cargo status information anywhere in the
world."

Are E-mails sent on HF?
This suggests the possibility of decoding such information (GPS data output
is a standard format) and getting much more info out of each intercept.
Really not too much above what ACARS does for the commercial flight world.

Matt

Not trying to be smart....
I would think that the GPS would work under the seat in a convertible. It might not see the horizon, but should see a lot of the sky. In this situation, I'd just hang the whole thing under the ragtop. The cable is about the same size as the coax would be and it would sure save a lot of work. But I'd still get rid of the yellow! :)

339. GPS STRINGS UPDATE

From: Tyler Parsons <tparsons@peak.org>
Date: Fri, 13 Dec 1996 11:57:30 -0800
To: aprssig@tapr.org
Message-ID: <2.2.32.19961213195730.00695660@peak.org>
Rendered body type: text/plain

```
>>> Garmin45 v1.5    X     .      X        X        .     .     .    .
>>> Garman45 v2.0    X     X      .        X        X     X     .    .
```

Are the versions in the above representative of the software version displayed in the GPS, ie v2.43 would send strings represented above as the Garmin45 v2.0?

Thanks

Gee folks, one original posting and 2 additional postings about this
hoax virus that contained the complete text of the original. This
hoax is spreading quite well, thank you.

Please don't forward messages about viruses unless you investigate
whether or not they are real. There are a number of sources, including
the McAfee and Symantec web pages that give information about real viruses
as well as the common hoaxes such as Irina, Deeyenda, and Good Times.

If you actually get a virus, then we will be willing to hear of it, and
in particular, how you got rid of it.

And please, you will be doing the rest of the mailing list a favor if
you will cut out the irrelevant parts of messages before replying.

Thanks

Relative to the flat black paint for the Tripmate. Anyone have an idea how
a black painted Tripmate will fare during a Texas summer? I think it would
get pretty hot!

346. $GPRMC Sentence

From: bbliss@juno.com (William B. Bliss)
Date: Fri, 13 Dec 1996 15:26:53 EST
To: aprssig@tapr.org
Message-ID: <19961213.122622.2151.2.bbliss@juno.com>
Rendered body type: text/plain

```
Hi SIGgers,
     Additional breakdown of RMC SENTENCE
```

Attn: GPS users...   Filed: 170500GMT MAR 96

Following protocol from Motorola Tech Support. May be of interst to APRS GPS MOBILE fans, posted several times past two years..

$GPRMC PROTOCOL, RMC GPS Message. Gives Time, Position, Course/Speed. Best for APRS use, plots your mobile unit as you move, for all to see on their maps.

```
       1      2 3       4 5        6 7     8    9      10 11 12
$GPRMC,xxxxxx,A,xxxx.xx,N,xxxxx.xx,W,xx.xx,xxx.,xxxxxx,xx.,E*xx<CR><LF
```

No.	Field	Units/Range
1	Time, UTC	Hours, Minutes, Seconds/
2	Status	A=Valid, V= Invalid
3	Latitude	Degrees, Minutes and Hundredths/ 00-90, 00-59, 00-99
4	Direction	N= North, S = South,
5	Lontitude	Degrees, Minutes and Hundredths/ 00-180, 00-59, 00-99,
6	Direction	E = East, W = West
7	Speed over ground	Knots/ 00.0 - 99.9
8	Course over ground	Degrees in referenced to True North/ 000-999 (000-359)
9	Date	Day, Month, Year/ 00-31, 00-12, 00-99/
10	Variation	Degrees/ 00-99
11	Variation sense	E = East, W = West
12	Mandatory Checksum	Hex - 7F

The above protocol data is as sent on a single Packet UI fram, like so:

```
WB6LPG-9
$GPRMC,095302,A,3727.39,N,12226.29,W,04.58,160.14,021094,15.45,E*4E
```

It is received as a plot/fix on you APRS Map as a Car&Call and heading line/flag, in the correct position and in your Position Log as foll:

```
WB6LPG   021094z020953/3727.39N/12226.29W>160/1.4/raw*/RMC Fix
```

If desired can send the $GPGGA sentence, for Time, Position, Altitude only.
but very similiar fields.

73's & Enjoy, Bill/WB6LPG (wbliss@coastside.net) Half Moon Bay, Calif.
NNNN

---

347. $GPGGA Sentence breakdown FYI

From: bbliss@juno.com (William B. Bliss)
Date: Fri, 13 Dec 1996 16:07:44 EST
To: aprssig@tapr.org
Message-ID: <19961213.130410.2151.6.bbliss@juno.com>
Rendered body type: text/plain

Attn: SIGgers..
And here is the GGA sentence breakdown..

All GPS/APRS USERS.   From Motorola Tech Support..

NMEA-0183 protocol/sentences for the $GPGGA data string, giving time, position, altitude.

```
       1      2       3 4        5 6 7 8   9    10 11  12 13
$GPGGA,xxxxxx,zzzz.zz,N,zzzzz.zz,W,x,x,xxx,uxx,M,uxxx,m*xx<CR><LF>
```

No	Field	Units/Range
1	Time/UTC of Posit.	Hours, Minutes, Seconds/ 00-24, 00-59, 00-59
2.	Latitude	Degrees, Minutes and Hundredths/ 00-90, 00-59, 00-99
3.	Direction	N = North, S = South
4.	Longitude	Degrees, Minutes and Hundredths/ 00-180, 00-59, 00-99
5.	Direction	E = East, W = West,
6.	GPS Quality Indicator	0 = GPS not Available 1 = GPS available.
7.	Number of Satellites Being used..	no units/ 2 - 4
8.	HDOP	no units/ ? - ? (Don't know what means, don't ask)

```
  9.    Antenna Height         meters/
                               -99 to 99 where u is sign if minus.
  10.   Units                  M for meters.
  11.   Geoidal Height         meters/
                               -99 to 99 where u is sign if minus
  12.   Units                  M for meters
  13.   Checksum (optional)    Hex 00-7F

   If you notice the above format in a packet message, this will give you
some information on what the position report means.
   For APRS the $GPRMC sentence is more acceptable as it give Time,
Position, Course, and speed.
   Whereas this $GPGGA data string, only give Time, Position and Height,
which I have been told is not accurate height MSL on GPS receivers,
below about 2000 feet.

    73's & Enjoy, Bill/WB6LPG   @ wbliss@coastside.net

If it's sitting on the dash for any length of time, I doubt that the peak
temp would be much different no matter what color it is! I've had clear
plastic cassette cases curl up like they were paper. I think that it would
only heat up faster if it was black. I'm sure a NON-metalic sun shade would
be helpful when parked, but I'd rather bake my Tripmate than my Garman 90! :)

There's a good question: What is the max temp rating for the housing
material? I don't think the color will affect the solar heating of an
object on the dashboard very much, in fact some paints can minutely
insulate thermal emission.

Dashboard objects run around 150 degrees F, on an 85 degree F day, on
a sunny Mid Western summer day.

But I admit that Texas is much closer to the equator...  (-:

See what your manual says about leaving the monitor command on when not connected to the 'puter. I understand that on some TNC's when left unattended the buffers will fill up and lock up the TNC. I am probably wrong but check it out.

Exactly. The Tripmate is watertight (Or resistant) and I don't mean to a dept of 100 feet, so don't pick this apart ;-). Just take the little rubber feet of the bottom and go to Rat shack and get 4 magnets with the adhesive backing and you have an external gps receiver. But then again WHY. I used mine several times with it sitting on my pickup dash and never last a single position, i did get a few yellow arrows but that didn't effect the accuracy at all.

Here we go again!. Of course you can do whatever you want, but again specially
in a convertible, and that you want to keep it hidden is even more reason to
leave it just the way it comes out of the box, well almost i would paint the
thing another color.

KAM Plus is the only thing! I have spoken so a lovley little lady at
PacComm in the past <grin> and the GATE feature is possible. Now that
Kantronics is the only player this may be a bit of an incentive for them to
start the fire burning on a GAZTE type TNC of their own!

You must have been lucky, my army of TNC's include two KAM's and I will
never purchase another Kantronics product again! I have found their tech
support to be very poor, mostly that they will not even want to listen to
what needs to be fixed but also just plain old support.

>
You missed the point...if you can see it, they will steal it. I want it
mounted _inside_ the roof...and the roof is too thin (and too weak) for
the whole unit.

It wouldn't work under the seat, only 20 or 30 degrees of sky would be in
view and much of that obstructed by the occupants. It does work mounted
under the rear deck, but the degredation of signals and obstruction of
part of the sky limit the number of satellites seen. The roof is the best
option.

Now that is a novel thought! How can the 232, which doesn't support dual
port (simultaneous) operation be used as a dual port gateway tnc? I have
one sitting here with the latest firmware and I see no indication that it
has any prayer of working in that mode.

Thanks so much for your 2nd comments about the Kam +...that is exactly the
kind of info I was looking for: "I have one, I use it the way you intend
with the software you are going to use and it works." I couldn't have
asked for more. At least now I know when the 2232 craps out and it can't
be fixed, (also knowing it will no longer be supported), I can go get a
KAM + and be happy. I hope the KAM + is a good performer.

Actually, it is a bit of a joke to say AEA ever supported the 2232. They
misrepresented its development from the first day. Made excuses, blamed
others and promised the moon. They delivered on very little, except some
very minor prom upgrades. They blew it. A marvelous dsp engine is inside
that thing and they botched it.

If I seem bitter...I am. 1 kilobuck in the toilet.

I would be very interested to hear about the KAM + performance on hf and
any other feedback about using it in gateway dual port mode with WinAPRS.

BTW - is there some way to eliminate the "p1:" that precedes every packet
received on the 2232?  We have one at a club station and when I've played
around with it and APRS, all the calls get logged with that prefix.  I
couldn't find anything in the manual that told how to get rid of it.

Thanks.

Kantronics has Excellent Tech Support! The KAM+ is (in my opinion) one
of the best Multi-mode TNC's available. Must confess that I don't care
for there software. I have 3 KPC-3's and 2 KAM's. I bought one of the
very first KPC-3's and a KAM's to hit the market. Over the years, I have
up-graded both of them as the up-grades became available. They (both)
are performing as you would expect a new current version to perform.

The firmware/hardware chips in the up-grades were easily installed, and
have performed flawlessly..! For my money, Kantronics TNC's are
peerless.

I use mine with WinAPRS and it is not bothered by the P1 P2 business. In
fact, I would think it absolutely needed to see those prefixes or it
wouldn't know how to assign HF or VHF as the source of the data.

I can't speak for dosAPRS because I never succeeded in getting it to run
properly with it. Maybe someone else can help you with that part. 73

Actually someone mentioned the best reason to put an external antenna
on it:  the temperature that anything exposed to the sun gets in some
climates.  On the other hand, the Tripmate would be expected to be
exposed to the sun in the designed application.  So, what's its
maximum specified operating temprature?

FYI, I've been running an old KAM for about 3 years now on VHF, HF and
occasionally APRS VHF/HF GATE, and never had a problem (which I couldn't
fix after READING THE MANUAL, DUH)...

I'm quite happy with their products.

For some reason, The messages I'm receiving in WinAPRS are all displayed in
the message list window with the date of 12/31, even though the computer
clock has the right date. I even tried clearing message logs and restarting
WinAPRS. Any ideas about fixing this would be appreciated.

Suddenly I am having a similar problem Win 1.1.7. No matter what I do,
the CMOS clock is right, and WinAPRS shows 12/31. Thought it was my
problem...am relieved to know other are finding it too. Any suggestions
would be appredicated!

> plastic cassette cases curl up like they were paper.

COMMENT: Ignoring convection and conduction by air, the black will absorb
3 times as much as white paint but covering it with aluminum foil would
make it 10 times worse! WHITE is the only answer to keep it cooler.
Strangly, altthough the Aluminum reflects a lot of the radiation, it
RETAINS it due to very low emissivity (thats why you use aluminum foil for
insulation).

My first GPS tracker, in a baking pan on the roof, I thought
would reflect heat due to the flashy surface. WRONG. It got blazingly
hot. Painted it white and it is COOL to the touch even on the roof of a
BLACK car in JULY sun.

Activity on HF seems down recently. SOmething wrong with my antenna? In
hooking up this MFJ to the antenna, it seemed like a full minute before I
heard a single packet on 10.151 today.

Exposing my lack of experience on the DC bands, I thought conditions got
better in the winter compared to the summer. I remember getting 5 full

```
pages every 2 hours this summer on weekends...(VHF and HF combined)

Rendered body type: text/plain

```
See http://www.cloud9.net/~alan/ham/aprs/.  In there find, aprsmon.tgz.
But, first, you can just look at the man pages that are referenced
on the web page for beacon, aprsmon, aprsdigi.

To build these requires ax25-utils-2.0.12 to be located in the same
parent directory (see the Makefile).  I'd appreciate those of you
Linux/APRS-oriented to test this stuff out and get me bug reports
and total rewrites of my lame code(;-) so I can shake it out some
prior to submitting it as a patch for possible inclusion on the main
ax25-utils-whatever-is-current.  Terry -- I'll get that patch to you
after a few days....

Even just reading the man pages and commenting on that would be
appreciated.

For those APRS-types contemplating this linux thing, start by reading
the AX25-HOWTO at http://sunsite.unc.edu/pub/Linux/docs/HOWTO/AX25-HOWTO.
For those Linux-types see http://www.tapr.org/tapr/html/sigs.html for
a good starting point.

N2YGK-8 is currently running aprsdigi as a conventional digi with
alias RELAY as well as SSID and WIDE-n routing.

Poor Tech Support is better than:

1.Disconnected tech support.(Brand A)
2. "I dunno! RTFM" Tech Support (Brand M)
3. Rude Tech Support (Brand P)

My "army" of TNC's are ALL Kantronics (Brand K)  and I would not own anything
else.  Never had a bad experience yet. . . Too bad you got burned.

Rendered body type: text/plain
```

```
I use my 9612 with a single radio, an Icom 275, and it works just fine.
The 9600 port is wired via 1/8" phone jack that I put into the right rear
corner, and the 1200 is wired in conventionally for AFSK.  I use a second
1/8" phone jack for the PTT.

The varactor portion sometimes interferes, with some stations only, with
the conventional AFSK side.  If so then I just reach around and unplug
the 9600 link from the 1/8" plug.

The rig works well.  To use 9600 I give the standard ~a before keying,
and to use 1200 I give the |a.

To: <aprssig@tapr.org>
Message-ID: <199612141446.JAA07890@grumpy.magg.net>
Rendered body type: text/plain

```
I thought I was happy with the KAM as a Preformer while it was the only HF
TNC I owned. I then bought a PK-900 and ran that for a while it it was able
to decode many more packets it seemed. I then ran 2 TS-850S/AT's into the
same antenna TX off of course! and both the PK-900 and KAM and KAM+ side by
side of different PC's.
Nothing scientific but I got more decoded packets with the PK-900 than
either the KAM or the upgraded one to KAM+. Bottom line for me is whatever
works better and the PK-900 does work better. It does stink that the
company left us but oh well, it happens!

This brings up a good point, when will be have more pages for P and L
lists. For some of us where VHF is popular and we have HF coverage the
pages fill up in no time! We have lot's of activity on VHF here and I
shudder to think what the NE is like now.

388. Any NE New Jersey APRS on VHF?

From: "Richard F. Garcia" <n2czf@magg.net>
Date: Sat, 14 Dec 1996 10:28:06 -0500

Rendered body type: text/plain

I am planing a trip back to New Jersey in a couple of weeks, is there any
activity up there yet. I have not been up there in 18 months and at that
time I got occasional coverage running 50 watts.

I will be in Morris, Bergen, and Passaic County for about 1 week but this
time I will only be able to bring a HT and mag mount. Is it worth while for
me to even bother ? I am trying to travel light due to the holiday mess at
the airports!

>Hey, Rich, long time no talk. Happy holidays to all.
My TNC is shot so not on APRS till I get 232 fixed or get another one.

What makes you think anyone wants you back in NJ since you pulled out and
deserted them?? (gg)

Hi All,

        For the past several days I have been trying to setup
and receive HF APRS on my AEA DSP-2232 and Kenwood TS-940.  I
hear signals on 10.151 USB and tune around carefully but cannot
copy any of them.  I have the DSP-2232 set for modem 33 (also
tried modems 10 and 11) and take the audio from the ex/sp. jack
on the TS-940 to radio port 1 on the DSP-2232.  I have tried with
WinAPRS, APRSdos, and just a terminal program, but cannot get
any copy.  The DCD led lights with the signals I hear but no
copy.
        Anyone using the DSP-2232 on HF have any suggestions??
I believe I have all the params setup correct, but maybe not.

KB6LFM WRITES:

Hi Chris. Suggest you use LSB, or better yet... FSK. Tune to
10.149.30KHz which is the real APRS 30m Freq. Also suggest you set your
TNC's "MARK" to 2125 "SPACE" to 2295 and the "SHIFT" to 170 and you are
in business.

been following the messages regarding mfj rig for aprs qrp!  i had written
mfj an e-mail a while back regarding using one of their rigs for aprs on 30m.
 i originally had thought of modifying their 9420 20m ssb/cw rig for 30m, but
it looks like the cw-only qrp for 30m will work.  am curious what mods are
needed to use the cw rig for fsk.  i think that's how you plan on
implementing it.  was also thinking along the same lines and using a crystal
oscillator or even a digi-vfo.  any info you have would be greatly
appreciated.  i have already successfully used my index labs qrp plus on hf
aprs qrp, along with rtty, pactor, amtor, etc.  it's suprising what 5 watts
can do.
thanks for the info.

KB6LFM WRITES:

Yup..! I wrote that.., It was me..!

SRI to hear that you had to call Kantronics with some basic questions
about up-grading your KPC-3 to the GPS Ver 6.0. When I up-graded my
KPC-3, all I had to do was replace 1 plug-in IC chip, and do a hard
reset. The documentation that came with the up-grade was very easy to
understand (even for a longshoreman... Hi.!) The point is; in my
opinion, and for my money, Kantronics is hard to beat. They are user
friendly, competitively  priced, still in business.....! The only time
that I have needed their "Tech Support" was when I wanted to hook-up my
KAM+ to a scope. I spoke with Don Rixon, who not only told me how to do
it over the phone, he also FAXED me a copy of the components location
with the modification penciled in. How can I bi*#h about that..!

Here is one for the SIG

     "Ever wonder why the JA's are not in the TNC business..?"

Another guy, equally as nice, but slighty confused , quipped:

> Excuse me!?  Did you really type that?  Kantronics with excellent
> tech support? C'mon, I called them with some basic questions about
> the GPS upgrade for the KPC-3 and I knew more about GPS than the
> person answering the phone

Me, knowing how exellent I was handled and passing on my excellent knowlege
on to the good honest folks here on the SIG responds with . .

When I originally contacted the TNC Manufacturers looking for the best
TNC to use for a Stand Alone Tracker, I got the most favorable
response from Kantronics.

AEA told me the PK-12 would not run on 12VDC. ( HUH?)

Paccomm told me that the one they recommended didn't work because of
faulty firmware, and when asked when they might have it working, the
nice man got quite rude with me and told me something to the effect
that it would be ready when it was ready!

The person at Kantronics didn't have any idea, (this was the
receptionist) and the person I needed to chat with was not currently
in. .  It was lunch and I guess the guy had to eat...  but would call me back
when he finished..  I got that call.. from a guy who knew loads more
than I needed to know!  THEN are you ready for this?  The
RECEPTIONIST contacted a sales guy who calls me back to check to make
sure the Techy called me back!  I was impressed!

Also, when my KAM had the dried Cap syndrome, they mailed me caps at
no charge.

>and they would not let me speak to any one responsible for the
>firmware or design of their hardware!

Now wonder why the Receptionist would not allow you to chat wid the
party . . .  Maybe away someplace in the Plant like mine was?

Hello Cliff.

Yes, 10.149.30KHz is the MARK frequency for APRS. I agree that some HF & gateway stations can be found a "little" off frequency from time to time. My guess is that this is caused by the sysop's not wanting to dedicate their primary station ($1,500 to $5,000) radio's to APRS. Most will be using a HF rig that was their "first" rig, or a "standy-by rig" that was once a "swap meet" bargain. These "seasoned" rig's are expected to drift. Alas, the need for "TUNE1 and TUNE2" aliases to "Ping" to.

The APRS Gateway Station here consists of a Kenwood TS-450s/AT zero'ed to N0AN, and is running in the FSK mode with the high stablity oscillator (TCXO SO-2) and Service Bulletin's ASB-1002 & ASB-1004 have been carried-out. For VHF I'm using a very seasoned Icom IC-228H. The Icom is running open squelch, and both rigs are connected to a KAM+. The KAM's configuration is; MARK 2125 SPACE 2295 SHIFT 170 and the "CD" command is set to "SOFTWARE". Antennas are a 1/4 wave verticle @ 35' for VHF and a 5 band quad @ 50' for HF. The quad's orientation is usually around 75 degrees magnetic. I hope you decide to join us here on APRS Cliff. SRI, I have no idea where a master EEPROM for the 232 can be obtained now. Perhaps someone here on the SIG can help.

This was not my (nor has ever been) my experience with Kantronics.  I've
called them a handful of times and only ever gotten to speak with a
receptionist who didn't know product at all.  I was told that the tech
people didn't take phone calls from customers.
>
>Now wonder why the Receptionist would not allow you to chat wid the
>party . . .  Maybe away someplace in the Plant like mine was?

No. I've been told a few times that the Tech people don't directly answer
customer's phone calls.  I've NEVER received a follow-up from them.  At
least PacComm has a person who's active in this SIG, and she knows product
and is quite helpful.

>
>> Ditto for the 9612 paging upgrade.
>

What difference does it make what my question is?  I'm not gonna plunk down
$200 plus to buy a TNC that may or may not support my $600 plus data radio
(or didn't you READ that in your little upgrade book?).  Kantronics nor HRO
is gonna refund my $$ if it doesn't work.

>> That's lousy tech support!
>>
>
>No, I don't think so.

I beg to differ.  Having worked in sales support I know what good service
is.  Kantronics gets a C- in my opinion.  Not that I don't recommend their
products, I do.  Because they work well and are easy to set up.

BTW, I bought a KPC-9612 PLUS today, at HRO.  This product is not even
mentioned on their web page, despite the fact that it is replacing the
DISCONTINUED 9612.  Even the guys at HRO were confused about it.  And they
talk to the OWNER of Kantronics on a regular basis.

```

Actually, it doesn't matter what my question is or whether it's covered in the upgrade manual, I should be able to speak with or get in contact with a person who knows the product and who can answer technical questions. I've been told by the Kantronic's receptionist (who doesn't know a TNC from a lamp post) that their tech people do not answer customers' questions over the phone. Why even have people who don't use the product they sell answering the phone? This is something I find quite often when I call "tech-support" at many companies.

I recently tried to upgrade my pager to alphnumeric paging via the internet. When I called my paging company, they (at alphnumeric tech support) told me there was no such upgrade available, I referred them to their Company Web page. Their response, "We have a Web Page?" Indeed. It took two more phone calls and a lot of yelling to get the service switched on. And when I switched back to numeric paging only (very few people availed themselves of the alpha service) they forgot to set a software switch and my pager stopped working. Their initial response was that my pager was broken and needed to go back to the regional office for servicing.
ARRGH! Again several more phone calls later I got my service back, and the tech sheepishly admitted that it was a problem on their end. And then they double billed me for a year's service...

What has this to do with Kantronics? Well that's what I feel like when I call them. I feel like the people who answer the phone have never used a TNC, nor are the licensed HAMS, nor do they care about their companies product. If Kantronics doesn't like my opinion, perhaps they'd like to respond...Oh, I forgot, their people don't even monitor this SIG...

It's amazing that when I've mentioned HRO, or PacComm, or Yaesu (and even Magellan); Pro or Con; on the internet; I've generally gotten (unsolicited yet polite and helpful) responses from official representatives of those respective companies. Never has that happened with Kantronics.

But they do make a good product. And as the Packet Coodinator of the ThunderBird (formerly Honeywell) ARC, I recommend their products to people who are looking for a first TNC. In fact, I just bought a KPC-9612 PLUS, today at HRO, a product not even mentioned on their web page, I might add. Heck, those tech support people must be so busy answering my questions that they don't have time to advertise new products. (g)

>
\>Here is one for the SIG
>
>   "Ever wonder why the JA's are not in the TNC business..?"

Ahh, but they are. They just don't market them much in the U.S. I have a Tempo MPP-1 made by AOR, and it is a fine PRINTING TNC. I also have three AR-1200's, which is the commercial variant. These AR-1200's were pulled from a Burger King out of California. I bought them because CERTAIN people on this SIG (you know who you are) stated that they could be converted to amateur radio mark & space tones easily and that they were using them for APRS. I have yet to receive that info, despite repeated private e-mail attempts and the offer of remuneration. One can only conclude that these people are full of "stuff" and that they have never seen an AR-1200 much less owned one. If anyone out there really does have this info, I would greatly appreciate it. The AR-1200 and the Tempo MPP-1 are significantly different on the inside, despite being identical on the outside.

Anyway, the Japanese do make TNC's. EEB was selling an AOR model that looks much like a product formerly sold by Heathkit and currently sold by PacComm. I didn't see it in their new 1997 catalog, but then I wasn't looking for it either.

73,

Mark

It would be really nice if the Tampa TNC manufacturer who makes an excellent TNC (best 9600 modem I have played with) would take over the digital portion of the AEA line. I would love to purchase a state of the art DSP tnc if it had modem code worth a hoot. I know the PacComm organization can handle it.

I was seriously considering purchasing one of the AEA DSP232 units after they improved the software code. The price was right for what you got and it is technologically in the right direction.

Tried to give a demo of the little rig with a long wire antenna. Again, the IF bleed through of SW broadcaster on 6 MHZ was stronger than anything on 30M so the AGC adjusted proportionally and you hear NOTHING on 30m.

Im sure all real users of this little portable rig, take along a TUNED dipole or an antenna tuner to get the most out of their 4 watts QRP. That alone would give probably most of the needed isolation at 6 MHZ...to prvent this problem..

Looks like the recieved data on the U-II tnc is getting sent to the U-II,
where it is echoed back to the tnc mixed with the U-II data. Fastest fix,
try setting FLOW ON on the U-II TNC, could also break the rs-232 data
going out of the tnc into the U-II.

Hi All,

        I have a Cyclades Cyclom-Y 8-port serial card on my
computer.  Windows recognizes the ports as com3...com11.  The
problem is that neither APRSdos or WinAPRS recognize any of
the ports.  WinAPRS says it cannot connect to the port and
APRSdos just hangs trying to connect to the tnc.
I know the Cyclades card is working as it shows up in the
control panel system hardware listing.  It also works correctly
under Linux.

        Is anyone using a Cyclades card with APRS?? and if so
did they have to do something special to get it to work??
Suggestions would be appreciated.

Jeez Guys!
 Apples & oranges, Fords & Chevys!  Everyone has their own story &
favorites.
  I finally had to jump into this.  I never had a problem with
Kantronics or their tech support.  I've had a Kam for over 5 years and
have a few occassions to call them.  Each time I have received all the
info needed within that one phone call.  And yes, I've been transfered
to tech support during the call.  Once, when calling about the now
defunct weather station of theirs, I was put in touch with a tech who
was extremely helpful..to the point of ridiculous.  He gave me a lot of
tech info well above what I needed or could comprehend.  However, it
answered the query.
  No matter.  Out of the thousands that call them, I'm sure that some
will have bad experiences.  That's just the odds.

Rendered body type: text/plain

OK- I have a simlar situation with WinAPRS 117. I use a KPC-3 at my Office ststion. When the PC is up and the program is running, I am on the map. When I shut down the PC, the Icon stops refreshing on everyone else's screens and I eventully drop off the map.

This TNC never did this with DosAPRS, and I have even set up the TNC manually to beacon, but after I run WinAPRS, the beacons stop. I have no exit commands set in WinAPRS that I know of.

I wonder what is golding off the TX of the TNC when WinAPRS is not running!

Anyone else with a similar problem? Anyone else NOT having this problem (you are updated on the map while the PC is off)?

And with all the work Mark says he has done recently- I sure hope he put in the backup file routines! It is such a pity to lose all the stations I have plotted just because I exit and re-enter the program.

416. HAcking the Tripmate

From: rwf <rwf@mindspring.com>
Date: Sun, 15 Dec 1996 13:39:10 -0500
To: aprssig@tapr.org
Message-ID: <3.0.32.19961213180502.0068e3e4@mindspring.com>
Rendered body type: text/plain

I'm all for a good hack- and I am glad that folks are reverse engineering the Tripmate, but I had this thought:

It seems that after we add external antenna ports, power supplies, microprocessors or special code to init the thing (the kind of init that tells it where it last was)- we could have probably bought a GPS module that's not ugly, is ready for external power, has a (powered) connector for an external antenna, and doesn't lose track of where it last was.

I still haven't heard if there is a speed or altitude limit, though. Something that cheap might be a good disposable unit for a rocket orballoon flight- although we have recovered ALL of our balloons and several of Bill Brown's too.

Rendered body type: text/plain

Nice story... but one's computer *still* cannot be infected by any type of virus merely by reading an email. A program or macro must be run, or an infected boot sector must be read from a disk drive. This looks like another twist on the "Good Times" or "PenPals" urban-virus-legend.

But Arte is right, we should know what we are running on our PCs! Run a background virus checker, scan all executable files before you run 'em, scan floppies as soon as you insert 'em, get a macro virus checker for Word, Excel and other programs that have 'em available and use common sense.

73 and Happy (virus-free) holidays!

-----------------

Chris,

I also bought one of those cards.  After reading the fine print, I
realized that you had to have special drivers (int 14, I think) to
handle the card.  They do not implement with individual com hardware
(16550 or like).

Because of this, very little software will work, unless they conform to
one of several standards mentioned in the Cyclades fine print...  So my
card is setting to the side for now!  My impression is that this card is
intended to support BBS software that have many incoming modem ports.

Wish I had known the gotcha's before plunging down the hardcash!

What is this?  From time to time when I power up my OLD kam, it won't start.
 I have to cycle the power switch a few time to make it work.  Is this the
'dried Cap syndrome'?

Thanks for any input.

My 2 cents:

When I called Rixon 6 months ago about trouble with KPC-3, APRS,GPS
hookup - Don told me that the only guy they had that knew anything
about ARPS & GPS left the company. Lotsa luck.

I would buy from Gwyn in a second if he had the product. The
only reason I hadn't mentioned PacComm was because they don't list, nor
have I ever heard mentioned any dual port hf/vhf tncs, much less
simultaneous operation.

there is a vacuum in the market now, with only one vendor,
Kantronics. I would much rather do business with Gwyn. They
have been first rate with me, and I love their products.

To run stand alone,  install r48 in the kpc3 to force the dtr line high
(this turns the tripmate on).

set GPSINT to ASTRAL

use a null modem adapter to connect the tripmate to the kpc3.
```

Works fine.

           TODAY'S TOURBUS STOP: Computer Viruses
```

Boo! Did I scare you? Probably not... but today's TOURBUS posting might, because we're going to talk about Computer Viruses. Ooooooh!

Let me start by saying that MOST of what you've heard about computer viruses is probably wrong. Your computer can't get one from a toilet seat, or by getting sneezed on by another computer that has a virus. You DON'T have to be scared of computer viruses, but you DO need to take certain precautions to protect your computer and its data.

This issue of TOURBUS will point you to some excellent resources to help you to learn more about computer viruses (and related nasties), ease your poor troubled mind, and protect yourself from the threat.

Let's start with a few (somewhat geeky) definitions:

A COMPUTER VIRUS is a program that can infect (invade) other computer programs.

A COMPUTER WORM is a self-contained program that is able to spread copies of itself, usually over a network.

A TROJAN HORSE is a program that purports to be fun or useful but actually does something nasty. It cannot spread like a virus or worm.

A MAIL BOMB is an e-mail message that can allegedly cause harm to your computer simply by opening and reading the message.

If you're not a geek, the difference between these five things is pretty subtle. One way or another, you're dealing with a malicious entity that can cause damage to your system. If you like, go ahead and call them all viruses, but beware that you're likely to be "corrected" by someone with one to many pencils in his pocket protector.

Are These Things For Real?

Viruses, worms and trojan horses do exist. Maybe you've heard of "Stoned", "Michelangelo" or others - these are real and can cause serious damage to a single computer or an entire network. Anything from spurious messages appearing on your screen to unexplained slowdowns to mangled files to a complete hard disk wipeout is possible.

But let me digress for just a moment to discuss some viruses that aren't...

- The "Good Times Virus" - is a HOAX that has circulated for several years. It's supposed to be a mail bomb, but such things simply do not exist. YOU CAN NOT GET A VIRUS SIMPLY BY OPENING YOUR E-MAIL. A virus can only affect your system if you install and run a piece of software.

- The "Netscape Mail Bomb" is not a real threat. A now-fixed bug in Navigator V3 could result in your system locking up when a certain bit of HTML code was encountered. Requests for more information about this will be cheerfully ignored. :-)

- PKZIP300 - is not a hoax, but it has become bigger than life. PKZIP300 is supposedly a rogue "Version 3" of the popular PKZIP software that is "circulating widely" on the Internet. Claims that this trojan horse program can cause damage SIMPLY BY DOWNLOADING IT are ridiculous, and to my knowledge it is not publicly available ANYWHERE on the Internet or elsewhere. See the PKWARE site at http://www.pkware.com for more info.

How Can I Avoid Computer Viruses?

First, you can't avoid viruses by shunning shareware, freeware or games. There are cases where even commercial "shrink wrapped" software was accidentally packaged with a virus.

The best course of action is to be cautious of ANY newly acquired software and to use "anti-virus" software that will automatically alert you to any potential dangers.

I also highly recommend that you read the "VIRUS-L FAQ" to get expert answers to questions like these and others:

- What are the known viruses, major symptoms and possible cures?
- Where can I get free or shareware antivirus programs?
- Where can I get more information on viruses, etc?
- What steps should be taken in diagnosing and identifying viruses?
- What is the best way to remove a virus?

This FAQ is online at http://www.bocklabs.wisc.edu/~janda/virl_faq.html and can also be obtained by sending e-mail to LISTSERV@LEHIGH.EDU with the command "INFO VIRUS-L" in the message body.

The VIRUS-L mailing list (also available on Usenet as comp.virus) is a forum for sharing information and ideas about computer viruses. Discussions include virus sightings, virus prevention and Q & A. To subscribe, send e-mail to LISTSERV@LEHIGH.EDU with the command "SUBSCRIBE VIRUS-L Your Name" in the message body.

Who Writes Malicious Computer Viruses?

Remember that kid in high school - the one you picked on because his pant cuffs didn't come down quite far enough to meet his cheap sneakers? Your merciless taunting drove him into the computer lab, where he sought revenge on the entire human race. This is all YOUR fault. :-)

Some Other Cool Virus-Related Stuff

I hope you'll read the VIRUS-L FAQ and get yourself educated on how to
avoid computer viruses. When you're done there, here's further reading:

```
   * ZDNet Download Help       - http://www.hotfiles.com/hlpframe.html

Hello,

But hacking is half the fun!

Actually if someone wants all that stuff the "Jupiter" board that is
the tripmate's big brother can be bought for about $220.

It is 5 volts DC power onlyand has 1 PPS output, antenna power input.
external antenna connection, DGPS input and the lot.

It is just a PC board with connector. You furnish the dc power regulator.
antenna, MAXUM RS-232 chip, and case.

Rendered body type: text/plain

```
Just figure! I am not planing to buy Street Atlas 4.0 so I delete most of
the mail reading a little here and there... then my boss goes off and
bought me a copy as a present!

This is the story, I installed it in my notebook, runing it off of a CD-ROM
and plugged in my Garmin GPS-50. I get good data coming in as read with
QmodemPro but when I Init the GPS function using "generic NEMA" I get no
reading. If I monitor the GPS in the SA window all I get is accuiring Sats
at the top but my GPS is already locked in. The GPS-50 as all the other
Garmin GPS units puts out the $GPRMC statement, does anyone know what I am
doing wrong ? I have run it a couple of times before using a co-workers
GPS-45 a few weeks ago and maybe (it has been a rough month!) even ran it
with my GPS-50 also. I really can't remember with a heavy workload and
final exams my brain is just starting to recover from overload!

If Gwyn is going to look at this, one consideration is the market. Established prices need to be looked at as well as the feature set and hardware. What we don't need is some cheap knock-off that uses a PLL demodulator on hf. Dual tone filtering like in the PK232 and above are a must. PLL decoders just don't cut it on hf. I don't know anything about the KAM + in terms of its filtering, but given a report one user sent me regarding the comparative performance of his PK900 vs the KAM...it sounds like the KAM might be using a PLL demodulator, or poorly implemented filtering. I don't mean to imply that PacComm would do a cheap knock-design...I am just worried about the bottom line approach that I see taken all too often in hf amateur packet gear.

<rant on>

The sad part about this is that it ain't rocket science. It isn't new technology. Good rtty demodulators have been around for 20 years, but too many manufacturers have tried to get by on the cheap with the PLL design that works marginally well on vhf, where S/N are quite high, but much more poorly on HF, where
noise is part of life.

The good hf units (AEA PK232 and above) all incorporated reasonably good filter design. The rest, when compared side-by-side, are rubbish. Yes, they work...but very poorly by comparison, much like saying "I worked Europe on a coat-hanger."

In my own side-by-side comparisons, feeding the same audio into two units, i.e., PK-232 and DSP-2232, the 2232 copied MANY more marginal packets than the 232...and keep in mind, the 232 uses dual tone filtering, or at the very least multi-pole demodulation filtering. Those of us using PLL demodulators are getting performance FAR worse than this and probably don't have a clue regarding how bad it really is.

I don't mean to get off on a rant here, but the reason AEA was so popular was because they did some things much "righter" than the competition. (One of which was not customer service, at least in my own experience). Their hardware was very, very good.

What does all this have to do with APRS...well...those of us on HF need an alternative now that AEA has gone under. Further, if Bob succeeds with his experiments with an inexpensive, but low power rig for hf aprs, we are going to need the best demodulators we can afford. 20w (assuming the 5w rig and amp), isn't a lot. Good antennas are not exactly common on 30m aprs, either. With many of the stations currently running 100w out, going to 20w and feeling good about it is kind of scary. 5:1 power reduction is > 6 dB loss.

The door is open, examples of good equipment for a reasonable price are available (unless the price structure is what put AEA under...which I doubt). Now all we need is some savvy entrepeneur to fill the vaccuum.

<end of rant>

    Mind The Gap
    Low-cost GPS devices: A gift for the disoriented
    By Jim Louderback

Did you ever go orienteering? It's a ton of fun! You basically try to follow
a polygonal course through the woods with only a compass and a topographic
map for tools. It's great to run through the forest, sighting marks,
matching  physical contours with elevation lines on the map and navigating
by your wits alone.

I can imagine that sailors feel the same way about navigating by sextant. It
must be so liberating to chart a course with only the stars, a map and a
small device in hand.

Alas, just as LORAN towers and other navigational aids have turned the
sextant into a curiosity, orienteering is
about to become an ancient art, more suited to medieval fairs than practical
navigation.

Why? Because a small company called SiRF is about to bring inexpensive GPS
to the masses.

You know about GPS, or the Global Positioning System.  Essentially, it uses
a network of satellites to determine, within a few inches, exactly where you
are at any time. Our benevolent military launched GPS to allow their death
machines precise targeting capabilities. But we consumers will put it to
better use.

Civilians are already using GPS today, of course. Many businesses use it to
track delivery vans, and Avis puts GPS into some vehicles. (If I hear that
obnoxious "Mommy's lost" ad one more time, I'll scream!) But these devices
cost way more than $500 and have significant startup and performance issues.

SiRF was started by refugees from S3, who hoped to apply lessons learned
there to GPS. S3 delivered some of the first inexpensive graphics chips to
the masses. A fabless design company, S3 created the chips that made
Diamond, Number Nine and many others rich. You probably use its stuff in
your PC.

SiRF has done three things right. First, it has dropped the chip-set cost to
about $50 today, and even lower down the road. Second, it has reduced
startup time to less than a minute. Current GPS systems often take 15 to 20
minutes to triangulate themselves into position. Third, SiRF is licensing
its designs widely, which allows low-cost developers from Taiwan and
elsewhere to build cheap products. Mitac has already committed to rolling
out SiRF-based products in 1997.

Imagine for a minute that it only costs $25 and a power source for any
object to know exactly where on earth it is.  Right away, Waldo, for sure,
will never get lost again. At that price, GPS can be built into anything
that moves, including notebooks, automobiles, bicycles, odometers and more.

Now imagine that the device can send and receive small wireless messages.
Suddenly you can locate any object anywhere (as long as the batteries last).
Kids, dogs, important packages, your boss, anything. Nothing would ever get
lost again--even if it wanted to.
```

Of course, there are still some challenges (a.k.a. problems) with GPS. Those satellite signals can be obscured by foliage, high buildings and tunnels, or confused by signal reflection. SiRF is addressing these problems, but it won't be able to solve them all.

Still, like SiRF, I'm excited about GPS everywhere. Now I really never will have to stop for directions.

"She"'s a "He".
And is the Owner of the Company to boot!

I agree with your comments about Kantronics. Pretty good stuff, but no help from the Factory and no obvious Tech Support any of the times I have called.

Ralph

BTW

I think the owner of Kantronics has at one time been a bit active with APRS- at least he DID come to the APRS eyeball at Dayton 2 years ago, but that is all the active APRS involvement I have seen since I have been involved.

I once suggested a software improvement to the KPC's GPS mode that would slow down the GPS beacon rate when a vehicle was not moving, but they told me it couldn't be done because they only retransmitted the NMEA. I disagree, and am pretty sure another Company WILL do this for us when priorities permit.

Just my 2 cents, Have been running a KAM (old style 7.1 firmware) for 2 yrs

or so and no problems. No real difficulty dealing with Kantronic either,
BUT,
I also have a PicoPacket from PacComm and it has been a real pleasure
dealing
with them. I would buy from them again as my first choice. I second
hasan''s post.

APRSdos REPLY/COMMENT:  As a new commer to QRP rigs, I am not a connoseur
(sp?) so if anyone has experience with them, please jump in with your
experiences.  Here are 2 tests needed.

1)  Anyone with a rig to space should monitor 10.151.USB  UPPER SIDE BAND
for an extended period of time and see if there are any users up there.
If the USB is clear, then QRP direct conversion receivers should work
fine. If there is commerical or other users up there, then they will QRM
the DC receivers since they hear BOTH sidebands.  ANyone wtih any SSB
receiver can collect this data...

2) How well does your QRP rig receive packet?

To: <aprssig@tapr.org>
Message-ID: <199612160400.XAA11851@grumpy.magg.net>
Rendered body type: text/plain

```
Let me make a note here about some of the comments that I have made about
the KAM and KAM+ as compared with a PK-900. I do understand what everyone
says about not having any problems with the KAM models on HF, I did not
either for awhile.
When I suddenly became unemployed years back and started a APRS GATE I had
a lot of time on my hands. I was given the PK-900 as a Christmas present
and did my side by side tests on both TNC's nothing scientific but used
same radios, same antenna and 2 PC's at the same time. I never was aware
that there were so many packets that I was not decoding until I ran both of
them for a few days and looked at the hit list.
If one did not have a PK-900 or DSP-2232 at this time and needed one, by
all means go right ahead and buy a KAM+, it is not that bad but again there
have (past tense) been better units out there for GATEWAY operations. If
you only want a single port TNC for HF and VHF at one time do look at the
PacComm TNC-320 that is a very good alternative if you do not need a gate
feature.
I for one hope that my PK-900 holds out for a few more years, it has been
in 24hr operation as a APRS GATE since 1992 now (So has my TS-850S/AT!) and
I do worry at times about how much longer it can survive.

Rendered body type: text/plain

With all of this talk about the KAM being the only GATE type TNC on the market now how about a alternate to a dual port TNC, possibly even cheaper.

How difficult would it be to have Howie N2WX modify the standard TNC-2 clone code to allow two TNC-2 clones wired back to back act as a GATE. This will allow anyone with a few of these TNC's run a gate at a low cost and hold us over until there are more dual port GATE TNC's available again.

The clones are so cheap and plentiful that it may be a good idea even if we had more dual port choices. I often see these TNC's for sale at $60 or so used and even new they can be had for $119!

Don't forget REMOTE SYSOP stuff too.  For those remote hilltop Stand
Alone Weather Stations and DIGI's that require a new BT or something
once in a while.   This would also be handy for those Stand Alone
Trackers that get away without the right BT to display a symbol
during an event, had that before.

Of course that might not be in a Dualport model but maybe in the
unit that has two Serial Ports.

that before.

I was talking to BOB last nite about the expensive power/data connector for
the GARMIN 45 series GPS receivers.

It's been awhile since anyone has posted the web site where a guy is making
his own and also selling them for a "donation".

http://home.cdsnet.net/~purple/projects/g45contr/g45_idx.htm

He has a big form press, so he turns them out by the 1000s. He even has the
little pins for the connector. So if you have a GARMIN 45 or a GARMIN that
```

uses the same 4 pin keyed round connector, check out the web page.

This does not address the hardware problem. The VHF tnc's that are kludged to run on hf use the SAME PLL demodulators whose performance stinks on hf. So there is no advantage at all to having two tnc's, if the 2nd one that is to run on hf doesn't work worth a darn.

I put a long ranting post on about the issue earlier this weekend. If the issues raised in it are not addressed (hardware issues), then there is nothing to discuss and no progress has been made.

>

WinAPRS has a serious bug in the conversion from internal date/time representation to actual displayed date. The first apear a couple of months ago but ONLY on the last day of the month. Now that we are in the last month of the year, the rest of the bug showed up.

I now have it fixed COMPLETELY and it will be in the next release.

```

Does no one see anything wrong with this? The course in the NMEA sentence is indicated as 160.14. In the APRS log, it's 160. So far so good.

But the speed in the NMEA sentence is 04.58 but in the APRS log it's 1.4. 1.4 looks like the fractional part of the course with the decimal point shifted.

Perhaps a bug in dosAPRS?

On another note, the GPS's we're using in the Civil Air Patrol in Illinois (I'm not sure of the model number, but it's a Motorola with no display) output a time stamp of the format hhmmss.ss, and the speed is of the format xxx.x (only one place after the decimal point and the whole numbers are not 0 padded to the left.

Perhaps the format given above is NMEA 1.5?   Can dosAPRS handle both?

Rich

Naw, there aint much up hear, I only get about 200 stations in about 3
hours show up on my screen.  Thats not very much now is it.  After running
a week, I had only 360 stations.

Mark

If you make a MS report, it would be so nice if you trimmed out all the
non MS stations, and then just included the lines from your BACKUP file so
that we all could load it and see what you saw...  It wouldnt take any
more lines of data...

>
> Works fine.

I have been trying this. I installed R48 and set GPSINIT to ASTRAL;
however, I am having problems with the KPC-3 sending the ASTRAL to the
Tripmate before it is ready to receive it. Hence, the Tripmate never
sees the ASTRAL from the KPC-3 and just sit there sending it's own
ASTRAL message. This has been verified by looking at the lights of a
breakout box connected between the Tripmate and KPC-3.

Sequence of events:
 Press power button on KPC-3.
 See handshale light come on.
 See short data burst from KPC-3.
 Pause.
 See long then short data burst from Tripmate followed by continuous
   short bursts.
 After while, briefly short pins 2 & 3.
 Start seeing long burts from Tripmate.

I even loaded GPSINIT with ASTRAL<ctrl-n>ASTRAL<ctrl-n>... upto the 128
character limit, hoping that one of them would get caught by the
Tripmate. For those wonder what the <ctrl-n> is for, this allows
multiple command to be place into a single command line. When the
GPSINIT text is transmitted, the <ctrl-n> get sconverted into <CR><LF>.

I either need to get DTR to Tripmate sooner or get KPC-3 to boot-up
slower.

Well that is a vote of confidance for the old Kansas Company.
I have not used their Host Master.
The other software that comes with the unit is both Good and Bad.
Good: You can run packet on an old piece of JUNK. (we have
lots-a-lightning here in Ks, and for most of us, a somewhat restricted
family budjet for purchasing computers!)
Bad:  It is not pretty to look at!
Yes, they do have PLAIN TECH SUPPORT. But you know how us Kansan's are.
Having fun at Holton, Kansas (Thats about 40 Miles from the KAM HQ in
Lawrence, KS.)
De AAØMM Ross (And they said you couldn't make a "Ø" in windows either!)

Why not just forget the GPSinit string and tie the Tripmate
pin 2 to pin 3 and let it self init.

Then only use the Tripmate GPS output pin to the TNC.

Hello,

But hacking is half the fun!

Actually if someone wants all that stuff the "Jupiter" board that is
the tripmate's big brother can be bought for about $220.

It is 5 volts DC power onlyand has 1 PPS output, antenna power input.
external antenna connection, DGPS input and the lot.

It is just a PC board with connector. You furnish the dc power regulator.
antenna, MAXUM RS-232 chip, and case.

465. North American Digital System Directory

From: Larry Keeran <lmkeeran@rs6000.cmp.ilstu.edu>
Date: Mon, 16 Dec 1996 16:22:47 -0600
To: aprssig@tapr.org
Message-ID: <v03007801aedb27fa5734@[138.87.2.109]>
Rendered body type: text/plain

North American Digital System Directory

The Tucson Amateur Packet Radio Corporation (TAPR), with the support of the American Radio Relay League (ARRL), will begin providing at the TAPR Internet site the information on digital systems that until now has been printed in the annual ARRL Repeater Directory. Information on digital systems will not be published in the 1997-98 edition of the Repeater Directory, permitting the publication to better focus on its primary use as a guide to voice repeaters for traveling Amateurs.

In planning the 1997-98 edition, the ARRL concluded that the Repeater Directory was no longer the most effective medium for this information. Discussions involving various regional digital groups that provide data to the digital section of the Repeater Directory led to the conclusion that TAPR was the logical group to take on the task of a new North American Digital System Directory.

This new database system will describe systems used by amateur radio stations involved in digital communications in the United States, Canada, and Mexico. The Digital System Directory will be based on information provided by regional, state, and local organizations as well as individuals in a nearly real-time format. This should allow information to be maintained and updated more frequently than in a yearly publication. TAPR will also work with participating organizations to make this information available on TAPR's yearly CD-ROM as well as some future publication for local/regional groups to distribute.

The purpose of the Digital System Directory is not to manage, coordinate, or regulate the usage of digital systems, but to provide the most up to date and accurate listing of digital systems that can be provided. Neither is it a formal organization, but a mechanism to allow regional groups to provide and share information regarding digital systems.

The Digital System Directory is intended for use by individuals to further their enjoyment of the hobby and by organizations to help plan and develop digital networks.

Regional/Local groups including TwinsLAN, Texas Packet Radio Society, Miami Valley FM Association, Ohio Area Repeater Council, Puget Sound AR TCP/IP Group, Northern California Packet Association, Northern Illinois Packet Radio Frequency Council, Indiana Digital Experimenters Association, Central Lakeshore Experimenter's Digital Organization, HogNet Packet Radio Association, YCCC Sysops Association, and the Missouri Amateur Packet Radio Society have already begun to participate in the process. TAPR encourages other regional groups to support this project by contributing data from their respective areas.

For further information on the project and how to get involved, regional groups should check http://www.tapr.org/directory or send e-mail to Carl Estey, wa0cqg@tapr.org

Well, if anyone wants to hear a VY weak signal, try to digi off of W3ADO on HF in Annapolis. It's an MFJ QRP CW rig running 4 watts into 150 feet of coax and an MFJ antenna tuner. It will probably drift too, so good luck!

FSK mods were one jumper and a 22k resistor driven from the FSK output of my KAM. It uses the RIT knob for adjusting shift.

Now all I gotta do is order a VFO xtal.

Receiver sens is down a few DB compared to my Kenwood.

467. dfJr multi port/gps/aprs77e -- working for anyone?

From: gphowell@mindspring.com
Date: Mon, 16 Dec 96 23:48:59 -0500
To: aprssig@tapr.org
Message-ID: <199612162357.XAA179554@mule0.mindspring.com>
Rendered body type: text/plain

Yesterday our local club planned a T-hunt and since I had carefully introduced enough cockpit error into the last one so that nothing really worked well, I started Saturday on this one. Setup: dfJr to multiport adapter, GPS-45 to multi port adapter, PICO to multiport adapter and adapter to Toshiba laptop. I was unable to get dos version 77E to acknowledge or use the GPS posits coming in no matter how I set things up.

Tried SPM with no TNC, SPM with TNC, HSP with PICO -- GPS still connected to multiport adapter, nothing worked. It appeared that posit reports as well as DF bearings were sent to the serial port, and the program did parse the df bearings and display them on the screen, but never would it change the initial position that I entered. At one point the program was telling me that it was not getting a position report therefore it was not displaying a bearing. I did see NMEA sentences scrolling across the bottom of the screen and lat/long was changing but was ignored.

(I DID remember to use the correct registration numbers this time unlike the last time...)

Any ideas on what I am doing wrong? The only thing I didn't try was connected the GPS to the second serial port on the PICO and try HSP, but I suspect that wouldn't have worked either since I don't think the multiport adapter does HSP. Grrrr. Help appreciated, Bob says he doesn't know either since he hasn't run this configuration.

Thanks!

> Tried SPM with no TNC, SPM with TNC, HSP with PICO -- GPS still connected to multiport adapter, nothing worked. It appeared that posit reports as well as DF bearings were sent to the serial port, and the program did parse the df bearings and display them on the screen, but never would it change the initial position that I entered. At one point the program was telling me that it was not getting a position report therefore it was not displaying a bearing. I did see NMEA sentences scrolling across the bottom of the screen and lat/long was changing but was ignored.
>
> (I DID remember to use the correct registration numbers this time unlike the last time...)
>
> Any ideas on what I am doing wrong? The only thing I didn't try was connected the GPS to the second serial port on the PICO and try HSP, but I suspect that wouldn't have worked either since I don't think the multiport adapter does HSP. Grrrr. Help appreciated, Bob says he doesn't know either since he hasn't run this configuration.

Geep,

I only ran this combination once with DOS APRS to verify it was all working.
It's been a while but I did follow the instructions from Bob's readme/df.txt file.
and it worked just fine.

Clip!--
AUTOMATIC INTERFACE TO THE AGRELO DFjunior:

The multi-port adapter combines your TNC, DFjr and GPS data all into the same PC COMM port. Using this adapter, configure APRS for one port TNC operation (even if you are not using packet), then use alt-SETUP-DF menu to select the DFjr. This tells APRS to watch for DF data on the TNC comm port. THen select the GPS-SPM mode under the alt-S-GPS-MODES menu so that APRS will also parse GPS data on the TNC port. Even if you normally run HSP mode with other TNC's, your HSP adapter is not being used. The DFjr is doing the switching so SPM mode should be selected. (If you have the dual port Pico-TNC, however, then you must select HSP.) The multi-port adapter normally passes TNC data straight through to the PC. But when the DFjr outputs a report, it sends out a POSIT followed by a DF report which are combined with the TNC data at the COMM port.
end clip!---

I activly use WinAPRS which works like a charm, except for the RELATIVE/TRUE calculation which is finished and coming out in the next release. The RELATIVE/TRUE calculation as absolutly needed if you are a moving DFer, this calculation takes the DF relative bearing and subtracts it from the actual vehicle GPS heading so that the correct bearing is displayed on the map.

HINT'S-

1.Try lowering the GPS posit rate from the DFjr so there are less collisions at the MPA with the TNC.

2.Try turning off the GPS & DF ports on the DFjr control head and do a MANUAL report, MENU, ENTER. This sends the most recent GPS POSIT first, then the DF info second.

3.Bob's notes say "If you have the dual port Pico-TNC, however, then you must select HSP" but I think you tried this.

4.I do recall now having problems the first time and Bob walked me through it, I remember it being very picky about the sequence of everything, do this first then this, then that, click on this, click on that.

If I get some free time I will connect everything, get it working and pass along how I did it, can't promise, time is very limited.

Forgive me if I'm wrong, but my first reaction is that the GPS rcvr
did not have a valid fix. Did the NMEA sentences have lots of commas
next to each other? Was the first character of them a "V"? This may
indicate it was still searching...BTW, in $GPRMC, a first character
of "A" usually indicates a valid fix (I think).

But then you said a GPS 45, it would have told you if it had a valid
fix...

I think I didn't word my first post as well as I should have.

This is in reference to the stations received on Friday night 12/13/96 at
approx
2315 to 2355 CST.
I was not running in the Meteor Scatter mode. I was running MacAPRS, (sorry Bob) unfortunately with the logging turned off. If it was a terrestrial band opening as Steve says, It was ONE HECK OF ONE, that just happened to coincide with the peak of the meteor shower.

Either way, from my QTH, it skipped Indiana,Michigan & Ohio, and was confined to Tennessee,Alabama,Georgia and the NE tip of Florida.

If it was a band opening, did the Chicago area stations also show up in the Southeast?

Perhaps you'll see them enter the GPS market, but probably not tncs.
I fully expect them not to expand their amateur market in the near
future.  From reports, sales have dropped off dramatically in amateur
gear for them.  They are closing out their 440 h/t with no plans on
a newer version.  Perhaps what has hurt them is what has hurt most of
the market out there.... internet.

Hello friends...H E L P needed....
Local CIvil Defense has requested since I am only Ham running
APRS-GPS in Ecuador, that I supply the possibility of acquiring
the "smallest-light weight   GPS ANT AND A TX VHF OR UHF TX
 to fly it on a   1/4 scale r/c model plane and observe
and
measure if possible some coordinates within the observation
by air   area and or areas.....

I know most of you can help out with the information on
brand, model, size, weight, of GPS and perhaps just a TX which
will bring inthe information into   APRS of course.

It will also only be flown for 20-30 minutes depending on FUEL
weight etc.

There may be also a   very small camera on board if it all
is kept SMALLEST system......
 Thanks a lot and will watch the flow.. forthcoming......

TED HC5K   02 55 65 s   079 00 56 W
RUNNING: PACCOM   TINY-2 GPS AND KAM GATE INTO APRS AT
 10.151 LSB 100 WATTS. DIPOLE.. LATELY LOW CONDITIONS DOWN
HERE...
 THANKS A LOT.

I have recently been using my KAM+ on HF. I found the sensitivity to be best
when I grounded the external CD line, but it would not TX. I guess APRSdos
found the frequency to be busy when used in this way. I changed the CD to
software and it would TX fine but sensitivity was not as good. I also have a
DSP59+ in front of it. I use FSK on TX not AFSK. Would appreciate any sig
reports.

I usually use it for working RTTY and find I can copy sigs into the noise.
The DSP helps here.

I will highly recommend the Clement MIM module as a small,
light-weight "TNC" for transmitting GPS data (no receive),
but works without fail. See:
http://www.home.navisoft.com/agrelo/clement.htm

The Agrello HPVFC VHF transmitter (very small & light) looks
like a good choice for your needs. I have no experience with
```

```
it however. See:
http://www.home.navisoft.com/agrelo/ae.htm

FLOW was on, ECHO was off. However, following your other idea, I
disconnected the resistor on the U-II interface cable 25 pin plug from pin
2...problem solved!!!
I'm not sure what purpose, if any, the resistor serves in this application,
but it's been working perfectly for 24 hours.

Thanks much!!!
Gary N3HCP

Don Pfister KA0JLF wrote:

>
> I see the NMEA GPS lat/long is in ddmm.mmmm format. Are these truely decimal minutes? Would .0001 be .0001 of a minute?

Yes, but not all receivers return 4 digits to the right of the decimal point.

> Does this sound right? From the refernces I have found, it says one degree is made up of 60 minutes. One minute is made of 60 seconds. It says one second at the equater is 1 nautical/geographic mile. One nautical mile is 6080 feet. So 60 x 6080 = 364800 feet (at the equator - long. I think). Now .0001 x 364800 = 36.84 feet. Am I on the right track? If so what do you do when you move away from the equator? What about Lat.?

The units conversion question comes up frequently, so here are some tips and definitions that may help. I prefer to make use of the fundamental definitions of quantities which are:

(a) The original definition of the meter from the 1800's (which is still correct to better than one part per million) is that the meter is 1/10,000,000th of the distance from the pole to the equator (i.e. 90 degrees of Latitude)along the meridian of Paris. So by simple units conversion we get:

90 degrees of latitude = 10,000 km
or 1 degree of latitude = 10,000/90 = 111.11111 km
or 1 arc minute of latitude = 111.1111*1000/60 = 1851.8518 meters

(b) As an aside, the definition of the Nautical Mile is (as you indicated):
1 degree of latitude = 60 NM
or 1 arc minute of latitude = 60/60 = 1 NM

(c) The definition of the "legal" inch and foot are:
1 meter = 39.3700000 inches = 3.2808333 feet

(d) Combining (a) and (d), I get:
1 minute of latitude = 3.28 * 1852 = 6075.62 feet

(e) If the earth were a sphere (it isn't quite), then at the equator the distances would be the same as in latitude. At 40N or 40S, we would have 1851.9*cos(40)=1418.6 meters or 6075.6*cos(40)=4654.2 feet per arc minute.

While I'm doing a tutorial, let me note that the earth is >>NOT<< a sphere and that these figures are >>SLIGHTLY<< incorrect for arcs of longitude. The earth is in fact an oblate (flattened) spheroid with an equatorial radius of 6378.16 km and a polar radius that is ~22 km smaller (reduced by a factor of (1 - 1/298.25) to 3956.77 km. When the "true" equatorial radius is used to express east-west distances (in Longitude), we find that one arc minute of Longitude at the equator is 1855.3 meters = 6087.3 feet.

When we apply the cosine(Latitude) correction, we get the following table:

		------ Longitude Distances --------	
Latitude	Cos(Lat)	meters/arc minute	feet/arc minute
0	1.0000	1855.33	6087.03
10	.9848	1827.14	5994.56
20	.9397	1743.44	5719.94
30	.8660	1606.76	5271.53
40	.7660	1421.27	4662.94
50	.6428	1192.58	3912.67
60	.5000	927.67	3043.52
70	.3420	634.56	2081.89
80	.1736	322.17	1057.00
90	0	0	0

Answering your other question, The NMEA messages from most receivers have a
precision (but certainly not accuracy) of 0.001 arc minutes (i.e. ddmm.mmm
format) corresponding to distances of ~1.5 meters or ~5 feet; but some have
one more digit in their NMEA reports (ddmm.mmmm with the smallest digit
~15 cm or ~6 inches) and I've seen some with reports to only .01 minutes
(ddmm.mm, corresponding to ~15 meters or ~50 feet). The NMEA specification
does not require a particular precision for the Lat/Lon report.

You used the "conventional" 6080 feet = 1 NM definition. This gives an
approximation to the usual assumption that "60 NM = 1 degree". But from
the numbers above you can see that the "correct" value is more like 6075
feet in latitude and somewhat larger (6087 feet) at the equator for one
arc minute. But the numbers are close!

Sorry to be slow getting this out -- I was in Japan all last week! Hope the
tutorial helped -- 73 de Tom, W3IWI

These messages indicate that you are not receiving any GPS satellites.
The long strings of ,,,,,,, nulls will disappear and numbers will be
in the fields when it is working. The GGA and RMC messages will have
your lat/lon in them, and the GSV message will show the Az/El/SNR for
the satellites you have in view.

```

I don't know about the Tripmate side of things, but on the RF side,
I'd strongly advise that you put a small RF choke between the coax
and the +V connection so as to not present too wierd an impedance to
the antenna/preamp.

A suitable RF choke for the L-band (1575 MHz) frequency can be made
with a 2" long piece of #30 wire-wrap wire wound on a 1/16" drill bit.
You'll get about 8 turns out of the length. A drop of fingernail polish
or superglue will hold the choke together.

Fellow SIG members:
        I have been following the discussion re: meteor scatter DX ever
since Bwana Bob reminded us that the shower was to have been last
weekend. Below is a portion of my log from Saturday
(14 Dec) morning (9AM EST). This looks like a great DX at that time.
        I'm just outside of Toronto (west) and couldn't believe my map.
What a mess!

        Also included is the "heard log" from the overnight monitoring.
Great DX.! Anyone see themselves??

        73 de Jack VA3JAX

Check MiniCircuits web site:

   http://www.minicircuits.com

Instead of the older MAR-6 you might want to consider the newer ERA-3
MMIC -- it has ~20 dB gain and better noise figure. You do have to
use a different biasing resistor in the +Vcc line (MAR-6 typically
uses ~100-120 ohms for +5v, ERA-3 needs ~39 ohms).

>
> 73 Eric eac@shore.net

You might want to scan the status report for my "Totally Accurate Clock"
project on the TAPR web site:

     http://www.tapr.org/tapr/html/tac2.html

The TAC-2 kit (Real! Soon! Now! [I hope]) has the power regulator,
MAX232,
etc and is intended (in part) as a "universal" mounting board for GPS
receivers. It is designed for "plug 'n play" mounting of the Garmin
GPS-20,
Motorola ONCORE and Trimble SK-8 receivers, and it has solder pads and
options
for any other receiver you can think of.
```

It looks like we will/may be able to get the ONCORE VP and possibly the
Trimble SK-8 receivers for about the price you mention for the Jupiter
if
there is any interest.

Regarding the power supply issues, the TAC-2 board has provisions to use
either a grungy, common 7805 chip or a small switching supply as an
option.
For those of you who are interested in the switching supply, the ones we
are using are made by Power Trends and they have a web site at

     http://www.powertrends.com

In particular, look at the PT5101 series 78xx drop-in replacements. They
deliver ~80-85% conversion efficiency at up to 1 Amp load. They also
have
a nice 1.5 Amp unit, the 78SR series that provides up to 1.5 amps. The
TAC-2 will take either the PT5101 or 78SR regulator. The PT5101 is in
stock (~$12) at DigiKey:

     http://www.digikey.com

Also, if you check all the right boxes on their web site and sound
legit,
Power Trends will send you a catalog and a free sample!

Clifford Buttschardt wrote:
>
> So who gives a good damn what RadioShack thinks! They have NEVER cared what ham radio is about and could care less!! Cliff K7RR
>
Jeez, Cliff. Get a grip. A long time ago, before Radio Shack was
"Radio Shack", they had some pretty good amateur gear. Then, as they
formed into Radio Shack, they had some interesting kits...you know..
build your own crystal radio. What a concept to today's hams! And
one more observation. Can you name another store..readily available
in most cities in the country where you can walk in and get a manual
to help "elmer" your friend..your neighbor..your spouse.. into
amateur radio? I think not. Let's not even talk about their re-entry
into the amateur market within the last 5 years with radio equipment.
Or their 2mtr h/t which has an excellent receive front end.
  No.. I don't work for Radio Shack, nor do I care for some of their
products. I just don't like to see anyone get a bum rap without looking
at all the facts and history. RS by far, is nothing more than a
simplistic neighborhood electronics store for the "average consumer".
Nothing more, nothing less. If you want quality Name Brand ham gear
(key word..Name Brand), then you shop elsewhere. Though, I daresay
that quite a few thousand hams out there are using RS h/t's with little
problems. RS is, as most companies are, run by corporate decisions
and marketing demands. If the demands show GPS to be worth their while,
they will market it. If the market shows a major drop in sales of
amateur gear, they will drop it...etc, etc.
 So, in essence, your statement that "They have NEVER cared what ham
radio is about and could care less" is a little unfair. You must have
had some bad experiences with them. Live with it. I don't care for
Yaesu, but I don't make a broad statement like that. There are too
many Yaesu owners that have never had problems.
  To the SIG: Sorry. Just had to get on the podium for a minute.
Thanks,
        Robert

Hello,

If you look on the back side of the tripmate board the capacitor and choke
are there. The choke connects to the RF chip and I believe that the power
feeds through the RF chip for some reason. It may be possible to figure
out
the input pin.

Don't forget REMOTE SYSOP stuff too. For those remote hilltop Stand
Alone Weather Stations and DIGI's that require a new BT or something
once in a while. This would also be handy for those Stand Alone
Trackers that get away without the right BT to display a symbol
during an event, had that before.

Of course that might not be in a Dualport model but maybe in the
unit that has two Serial Ports.

that before.

Must agree with Steve on first versions of betas. Even the Netscape site has some caveats on this one...JPGs don't display right they say...audio is not active...LiveConnect and a couple of other functions don't work...it's also crash prone in Java according to Barksdale's boys.

They'll probably get it fixed in the near future...but (if I wasn't using Gold) I'd wait a version or two.

Would be interested in hearing what the brave find if you try it!

I have it loaded on my PC. I am not sure what you are referring to, with APRS JAVA..., however, I have tried to use it on live APRS sites, with no success. It just tells me that the browser does not have JAVA capability. I was wondering about the same thing...
What are you all using for JAVA to view the live APRS sites?? JAVA is very new to me, and I know very little about it..

499. Re: North American Digital System Directory

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Tue, 17 Dec 1996 10:20:21 -0500 (EST)
To: Larry Keeran <lmkeeran@rs6000.cmp.ilstu.edu>, wa0cqg@tapr.org
Cc: aprssig@tapr.org, wd5ivd@tapr.org
Message-ID: <Pine.GSO.3.95.961217095819.3647E-100000@arctic>
Rendered body type: text/plain

When you build the North American Digitial System database please be sure to require the following data fields:

```
    CALL
    LAT/LONG    (format DDMM.HH/DDDMM.HH)
    SYSTEM TYPE (Digi, Node, DXcluster, Gateway, etc
    POWER       (in watts
    HAAT        (in feet
    ANT GAIN    (in dB
    DIRECTIVITY (Azimuth if not OMNI)
    FREQ        (in MHz
    COMMENTS    (28 characters max
```

Remember that a file in the following format can be VIEWED by APRS
graphically on any APRS map as a user's aid which not only shows the
location and type of digital system, but also radio range!

p,WB4APR-1 111111 !111111/3859.11N/07629.11W#PHG2463/Annapolis

This line will plot the symbol for a DIGIpeater to the nearest 60 feet
nationwide showing a radio range circle favoring the southeast calculated
using the HAAT and antenna gain plus POWER. The power, height, gain, and
directivity are all encoded in the PHG2463 format.

Users should be able to Query your database and get a file generated
in the above format according to the following categories:

BY STATE
BY RANGE from a given LAT/LONG
BY TYPE: Ie, NODE, DIGI, CLUSTER, GATEWAY, etc
BY FREQ

Then anyone can read that file into APRS and *see* on the maps the
locations, ranges, and overlaps of these systems!

For an example, LOAD any of the following APRS backup files and see where
all the APRS digipeaters are or GATEways:

DIGI-E.bk   DIGI-W.bk   DIGI-SE.bk   GATES.bk

Paul,
Know nothing about Radio Shack WX plans. However, the Peet units can
pick up HF RF... Peet Bros. have a filter available for the problem.
Check out PEETBROS.COM for availability and pricing. We have a U-2000 at
EOC, and had the same RF problem. In addition they have a filter for the
Sensor lines cable, to avert static and RF from coming in through those.
They also have a filter to go between the PC serial port, and the
keyboard unit. I had an old PC that would spike out the Keyboard unit,
via the PC serial port, until I put one of those in line. Since that, we
have put in a newer PC, with no problems.

When in my DOCS I said to use HSP if using a Pico, this assumed that the
GPS was connected to the Pico and not to the DFjr.

So, if GPS is connected to the multiport adapter, then the DFjr is doing
the posit reporting. It should be in the OPERATOR PUSH button mode,
though... IE, only a posit and a bearing are reported when the operator
pushes the button...

Sorry, I just havent had the time to put it all together and go mobile!

We (the Sproul Bros and Bob) have plans to add the Radio Shack weather
station AS SOON AS WE CAN GET ONE AND ITS DOCUMENTATION!

We had heard a rummor a LONG time ago that we would get 'free' units so that
we could write the software. As of yet, nothing..

If anyone has more info on these units, PLEASE let us know...

I live in a smaller town of 3200. We had a Radio Shack, which was
managed by an Amateur OP. The RS went out of business. Now I have to
drive 30 Miles if I need so much as a Resistor or Cap. Never owned a RS

radio product, but I SURE MISS THE ONE WE HAD! I just chalk it up to "We
all have to eat".

Hi All KF7KN here in Red Lodge Montana,

I have just started an HF APRS station. I see over
two dozen HF stations on my us map. But, I am wondering if
I show up on anyone elses aprs map?

73, Chris / KF7KN

Tony,

On the Pk900 you use the command "UBIT 19 OFF" to turn off the p1/p2
prompt. I am not sure it its the same for the 2232 or not.

If you are using WinAPRS or MacAPRS, the P1 and P2 are VERY important if you are running dual-port mode.. This lets the software know were the packet came from and allows the packets to be flagged Blue(VHF) or Red(HF)..

508. Radio Shack (was Re: Gateway TNC after AEA Demise?)

From: N2ZRC@gnn.com (Arte Booten)
Date: Tue, 17 Dec 1996 12:03:53
To: aprssig@tapr.org
Message-ID: <199612171705.MAA29915@mail-e2b.gnn.com>
Rendered body type: text/plain

Hi All,

On Tue, 17 Dec 1996 Robert Jordan replied to Clifford Buttschardt who wrote:

>>So who gives a good damn what RadioShack thinks! They have NEVER cared what ham
>>radio is about and could care less!!

to which Robert replied:

>A long time ago ... they had some pretty good amateur gear ... their 2mtr h/t which
>has an excellent receive front end ... quite a few thousand hams out there are using
>RS h/t's with little problems.

I readily agree that "Rat Shack" is convenient, has a fairly wide selection of parts and doodads and is available. I also agree that the HTX-202/404 combo are very good radios for the money. The problem I (and many of us urban types) have has to do with "theory" and "reality." Tandy Corporation's "Official" policy is that it is against company rules to knowingly sell something to somebody that will be used for an unlawful purpose. In this case, selling an H-T to an unlicensed individual when that customer is going to be using it to transmit on the amateur bands without a license. About a year ago there was a message on the PBBS's from an RS executive (I forget who or what he was) stating this and that employees that did sell such equipment under these circumstances were subject to dismissal. That's the theory, anyway.

Of course reality is another thing. Mr. R. F. Jama walks into Radio Shack and has two hundred and sixteen dead presidents with him. He sees this cool-looking wallie-talkie and says "I'll take it." Plop, in the bag, charge the battery and key up! If the Sales Associate asks if the customer has a license (yeah, right!) all he has to say is "It's a gift," or "I'm studying for the test," and Radio Shack (and the employee) is off the hook. And we are left with someone who transmits wherever he sets the VFO, using any kind of language he likes and cusses you out and threatens you and your interference committee with bodily harm when you challenge him (since ham radio is supposed to be and, considering the FCC's enforcement of late, self-policing.)

As far as I'm concerned, I welcome Radio Shack's apparent stepping back from the source of their name. I'll never forget the conversation I had with a "station" who identified himself as "KB2GEORGE" some months back, almost none of which I'd care to repeat. But I know exactly which "Rat Shack" he, and his compadres, bought their HTX-202's from.

>RS is, as most companies are, run by corporate decisions and marketing demands. If
>the market shows a major drop in sales of amateur gear, they will drop it...

Yes, exactly. If we, LICENSED Amateur Radio operators, as a group, decided not to buy HTX-202's AND Radio Shack were to ask to see a customer's license when Mr. Jama plunks his cash on the counter, they'd drop it like a hot potato. But I sometimes wonder what percentage of those units are actually sold to those licensed to use them.

Don't get me wrong. I LIKE Radio shack for all the reasons Robert explained and more. My bug isn't with them. It is with the AVAILABLILITY of the HTX-202 to anyone that walks in the door. Remove that temptation from them and we may find a bit more civility and knowledge on our already overcrowded two-meter band. Let them buy some "Chicken Band" or GMRS radio to play with.

Robert, I hope you don't think this is a personal attack on you, 'cause it isn't and please don't take it as such. This is a touchy subject for those of us that have lived with this situation and tried (ineffectually) to correct it.

Sorry, it doesn't. Take a look at the POSIT log for W7KKE-15, below.
Is that supposed to be "30." as opposed to "030"?   I'm not sure,
but is it possible for dosAPRS to save the raw packet texts as well as
put out the posit reports?

Here is a sample from a history file of a flight by one of our CAP aircraft.
Some posits look good, others do not. Unfortunately I don't have the raw
NEMA sentences to attempt to determine what might have gone wrong.

Note in some cases both the course and speed exhibit a decimal point which
I don't believe should be there.

510. Peet Bros. U-500

From: joefoor@digitalexp.com (Foor, Joe)
Date: Tue, 17 Dec 1996 11:50:18 -0600
To: APRSsig <aprssig@tapr.org>
Message-ID: <32B6DD5A.782E@digitalexp.com>
Rendered body type: text/plain

Hi All;

I got my U-500 set up with a KPC-3 as a remote WX station (after many false starts) and it displays fine on APRSdos.

What do I have to do to make it show up properly in WinAPRS? So far, WinAPRS calls it a GPS station, with a weather symbol, with no wind indicator and always zero for temperature. The KPC-3 is setup in CONVERSE mode like the APRSdos documents say.

I tried searching the list archives, but didn't find anything about this problem with the U-500.

here's what my transmitted packets are:

```
KF4DYS-1>BEACON:!3054.65N/08528.34W_PHG7267/WIDE-RELAY & U-500
KF4DYS-1>APRS:$ULTW008A00CD02140000----000000000000----015F02C10064
```

TIA

Hello,

My Delorme Tripmate GPS FAQ is now visible on Peter Bennett's Web page. It is in the "Street Atlas and AutoMap Interface Programs" sections. The URL is:

ftp://sundae.triumf.ca/pub/peter/index.html

and my thanks to Peter Bennett for posting it.

I finally got a copy of the Zodiac serial documentation so I am going to be expanding the file soon with some more sample NMEA sentences. Input is welcome as this is my first faq file and there are still alot of gaps.

You need to use the DATA format that starts with "!!" to make it work with WinAPRS and MacAPRS..

I will also look at making it work with the sentance you mentioned ($ULTWO..)

Well sorry but i HAD to answer and throw in my 10 cents. A few years back i bought a
brand new computer system from them in a sealed box. When i got home and unpacket the
system i noticed the keyboard was dirty like it had been in use for a while inspecting
the rest of the system showed the same story. I repacket the system and took it back to
the Rat Shack. The salesman insisted it was new and only had the dirty keyboard because
they burn in all their systems (YA RIGHT). Just then i turned around and noticed
someone coming out of a back room and he left the door open, in that room where about
30 computers when it hit me (A class room) that they called a burn in room (AGAIN YA
RIGHT). They did take back the system. I called the main office in Texas and finally
got to talk to the person on top, he said that this is standard practice at radio shack
and that there's nothing illegal about doing that. In other words most of their
equipment may or may not be even new, in fact this has happened to many people i know.

I rarely go to Radio Shack anymore (Thank you).

QRZ and SAMs CD-ROMs require and Index file, Buckmaster does also, but we
supply the index file to them BEFORE they go to press so it is ON the
CD-ROM (thats why we really like Buckmaster).

In order for QRZ and SAMs to work, the index file must be the RIGHT one for
the version of the CD-ROM that YOU are using, this of course is a pain for
us to keep up to date with.  MacAPRS has always had the ability for the
USER to create the index file.  Over the weekend I finally got that code
working under Windows, so the NEXT release of WinAPRS WILL have the ability
to generate the index files for QRZ and SAMS.

Rendered body type: text/plain

Arte,

In JAN 1991, I called the 1-800 number for the HRO in Atlanta, ordered an
ICOM 765, 229H, 24AT.

Gave them my master card number and address. The ICOMs were delivered two
days later.

I happed to have just passed the "OLD" TECH then. But they did not ask if
I had a license. Except out of curiosity, they should not care.

As I understand, much of the TANDY/RADIO SHACK Corp. Management are HAMS.
But they got to make
a living at selling things that sell. So stocking all stores with lots of
HAM equipment (or HAM employees) doesn't work.

I tried to post a flyer for our local ham clubs "HAM classes" at a RADIO
Shack. They said, NO it was corp policy NOT to.

I sent a EMAIL to ED Judge, W5???, a VP at Radio Shack at the time. He sent
me a letter ON Corp letter head
saying it was MORE than OK. That it was corp policy to SUPPORT local HAM
clubs and classes.

Radio Shack has got to sell junk too. They are not the OLD Radio Shack, but
I am not 21 anymore.

As long as any store can sell Tobacco products, that when used as intended,
will kill the user.... selling HAM
equipment to anyone with money should be legal.

Like I said, I've "only" been a HAM since 1991. The bad apples I have heard
have not been on 2meters, they have been on 3.950 and
14.313mhz!   And they all had callsigns that seemed legal and above TECH.

...we... ALL have hot buttons.

Kent

Reminds me of what a very smart friend told me.

NEVER buy a computer from a store that sells - underwear, stoves, washing
machines, vibrators,
or remote control cars.

I buy only what I must at Radio Shack.   Like you said ... "rarely"

Kent

Ah yes,   my fault for leaving one critical part out.

You must use ASTRAL(ctrl N).

But I havent had any problems with timing. Yes the tnc sends the string
before the gps starts, but it always has worked. As soon as the sats
are aquired, everything works fine.

520. WinAPRS / MacAPRS web site

From: Mark Sproul <sproul@ap.org>
Date: Tue, 17 Dec 1996 15:22:08 -0500
To: aprssig@tapr.org
Message-ID: <v03007805aedcb0384023@[165.1.27.20]>
Rendered body type: text/plain

```
For some time I have been telling people that I was working on the Web
server for Mac/WinAPRS.  This was because of slow performance etc.

The web server for MacAPRS / WinAPRS is now on a new machine.  It is a
PowerMac runing Mac Linux. We have been testing it for a few days and it
seems much better.  The url is basically un changed,

        http://aprs.rutgers.edu/

You do NOT need the /APRS/ as you did before.

Because we changed the ip address were this name points to, your local DNS
servers may still point to the old one, if that is the case, try

        http://aprs2.rutgers.edu/

This will go away eventually so dont rely on it.

For those that have not seen it before, all of the Mac/WinAPRS and all of
the dosAPRS documentation is on line here.  The dosAPRS docs have been
orginized in HTML form (somewhat) and are much easier to navigate.

523. Autostarting SA4 with Tripmate

From: Joe Scalet <jscalet@echo.sound.net>
Date: Tue, 17 Dec 1996 16:10:33 -0600
To: aprssig@tapr.org
Message-ID: <32B71A59.41DC@sound.net>
Rendered body type: text/plain

```
Youn can put SA4 in the startup menu of windows and have SA4 autostart
on powerup. To use the Tripmate however, you have to punch the GPS radio
button and then click OK. Delorme says there is no way to auto start
```

Tripmate. Windows has the Recorder function and you could of course
record the two actions and reduce it to one FKey to start the macro but
that only saves one key press.
        It seems that I once saw a utility that would autoexecute a keyboard
macro in windows but I can't find it. Does anyone know of such a program
? tnx WK0G

To whom it may concern:
I share this email address with my father who responds to your messages.
 However, I couldn't help to notice the title "Radio Shack." Since I work
there part time as I am going to school I feel that I could answer your
question about the computer.

If the keyboard was dirty then it was on display. Radio Shack does sell
those computers, however the buyer must know about it and we offer a
protection plan ,TSP, similiar to an extended warranty for an additional year
to the present warranty or TSP you purchase.

However, if you do have a problem with any merchandise with Radio Shack you

```
should not face any difficulty.  Tandy, the owner of Radio Shack, emphasizes
customer service to practically any degree.  However, it is possible that you
might have had a pushy sales associate who was feeding you lines.  In our
back room we have possible one computer that is used, however we do not sell
them and they are sent to the district store for a discounted price.  If you
continue to face problems, always mention that you will call the district
manager of the main top dogs in Texas.

Hope to  be of assistance,
Sabrina Rusnak
```

Sabrina. You didn't read my message the person at the main office is the one
that told me that it was standard practice to sell the computers they used in a
classroom as new and that it was perfectly legal to do so. And by the way NOT ON
DISPLAY but in a classroom.

Another thing to consider is that I am speaking about APRS mobile, it is
quite a different story from a home station. Take a drive APRS mobile
anywhere other than in the shadow of NYC or SNJ region and you will find a
lot of nothing on 145.79. WA4JNF-4 covers some parts of NNJ well but not
that well. Unless N2MH-15 has changed in the past year he can be seen on
occasions in some parts but had little to no coverage into Passaic County.

Here is my take on the list so far:

To Radio Shack or not to Radio Shack ?

Kantronics vs Patcomm ?

Is Gwyn Ready male or female (No Offense) ?

Now I have no room to talk for I am not exactly dominating the list but let
us please get back to APRS. Hopefully soon I will be able to contribute
just as soon as my HPVFC, that I ordered over a week ago, arrives.

532. Re: [APRSSIG:7337] dfJr multi port/gps/aprs77e -- working for anyone?

From: Richard Roberts <rroberts@mcs.com>
Date: Tue, 17 Dec 1996 22:00:28 -0600
To: aprssig@tapr.org
Message-ID: <32B76C5C.1E04@mcs.com>
Rendered body type: text/plain

Hi there....
I also have the DF Jr and while I haven't hooked it up to my Garmin 45XL
yet, I have used it twice and discovered that one of the antennas has
gone deaf.

I have attached an email in regards to this for your information:

Joe -

Rich has correctly assembled the antenna but has gone the wrong way on
tests
at foxhunts .... Another 'hunter, Greg, saw the jr and liked it very
much.
He's worked with the Smith DF (from Austrialia??) and wanted help Rich.
So
Greg did some bench work on the DFjr, he did a check on the ant. with a
scope
and found one element not showing the sq. wave from element to ground
...
sounds like a good test - indicating one amp out...is this the best way
to
check'm out??? should Rich shoot it back to you?

Greg opened the ant. box and was impressed with the engineering. He did
note
a small shard of solder on the inside.

The folks using it have noted seemingly shallow reception at the start
piont
of recent hunts with the DFjr. Have you come up with any comparetive
sensitivity or is it subjective to the receiver ... and if so what's the
best
direction to go in RX wise.....?

I'm going to lend my antenna to Rich so he can hunt again this weekend
and
not freeze his nails off.

Greg suggested you might be able to do the test he did with a VOM...what
do
you think? Sure would be good to be able to field verify. Or is that
best
left to the lab...

FYI- We test all four channels in the switching box on a scope before
shipping, repaired 3 antennas yesterday and they all swear that they
didn't transmit through it but the damage proved otherwise, 2 blown
caps,
1 inductor, 1 P-Channel MOSFET, I MAR-4 amplifier, & one resistor, all
baked. I usualy don't say anything to the folks on the SIG after all
the customer is always right, right;-) I am not suggesting that Rich
transmited through his or blaming him, proof will be when it gets on the
bench.
Anyway I will test and fix the antenna for him/you, don't read into
this,
it may be our fault, just stating that most returns are from people
powering
```

up the HT with the with the audio and coax connected to the DFjr, some
HT's will transmit momentarily, just enough time to cause the damage.
Receivers are recommended, ICOM, Yaseu, Kenwood, etc. not scanners, they
are
junk.

> sensitivity or is it subjective to the receiver ... and if so what's the
> best direction to go in RX wise.....?

The DFjr is a doppler which produces some desensatizing by the antenna
rotation itself,
try using a preamp o help gain back some of the loss.

> I'm going to lend my antenna to Rich so he can hunt again this weekend
> and not freeze his nails off.

Try nail polish on those nails, hi.

> Greg suggested you might be able to do the test he did with a VOM...what

> best left to the lab...

The VOM is not a good way to test the antenna, a scope is, proper
voltage swings
need to be observed, as when we test before ship.

Enough bandwidth here.

535. Tracker

From: Dave Creek <dcreek@pixi.com>
Date: Tue, 17 Dec 1996 21:02:56 -1000 (HST)
To: aprssig@tapr.org
Message-ID: <Pine.PCW.3.95.961217203455.7799A-100000@neogodzilla15.pixi.com>
Rendered body type: text/plain

I am now in a position to build a tracker for my van. The plan so far is:

GPS: Trimble White Mushroom from an unknown source in San Diego, CA
TNC: Kantronics KPC-3
RADIO: Radio Shack HT-202
DISPLAY: KD6PBH Display Unit (if available)

The van is an '84 Postal van. The Trimble antenna will be mounted on an
angle bracket on the rear of the van body with the top of the antenna
above the roof line.
The radio and TNC will be in a .50 cal. ammo can along with 2 6 volt, 10
Ah batterys. Power from the van battery will be supplied through a relay
controlled by the ignition switch.
I plan to come up with a circuit that will lengthen the intervals between
transmissions when the vehicle is parked to cut down on battery drain and
also so as not to fill the aether with redundant signals.

Any comments pro or con appreciated. Send via email or to the SIG if you
think they would be of general interest.
Since Dave Dobbins moved to the mainland, I dont know of any APRS guru
here. Maybe I'll become one.

Rendered body type: text/enriched

We had our annual Ham Club Christmas dinner last night and a discussion of our deteriorating band conditions ensued.

One thing that was brought up was that certain amateur equipment manufacturer(s) is/are flooding the market with 2mtr/70cm and HF gear. Do they see the handwriting on the wall and are emptying their warehouses? No problem - right - except that it is being done through TRUCK STOPS (maybe other places too). One of our members has been a ham for 8 years and is a truck driver and comfirmed this as so. Just stop in and buy no questions asked. That is why there is garbage on the air calling itself "The Ham From Hell" and I am sure others turning the spectrum into what we all feared.

That brings me to my point - We all have our little distractions - APRS, SS, Packet, SSTV, etc. What Amateur does not have a considerable sum tied up in equipment? With all the wolves just waiting to devour the all frequencies we hold dear - What good is all of our equipment going to be if suddenly the government comes out and says " These frequencies are too valuable to use in the current manner your are using them so cease and desist." For those of us with valid licenses and legal equipment used legally we get screwed or...... maybe dump the stuff on a blackmarket?.. yeah right.

Point is if we don't think about what is happening to the "carrier" of all our distractions -- WE WILL LOSE - - big time.

BTW not all Radio Shacks are Corporate. There are those that are independant and care what they sell and to whom. They control what they order and sell not what Corporate says and usually have a better stock of goodies for us builders and tinkerers.

There is a place in the KPC3 to install a 4.7k resistor which is identified as R48. This will pull the DSR & DTR lines high.

Bob,
Well Well,,, Windows-95... I know the wonderment! Have you noticed,
that with the older first versions of DOS, and WINDOWS 3.1, you got a
MANUAL?? I mean a MANUAL???
Now with WIN-95 we get a phamplet! HI HI... The largest op system yet,
from IBM Compatible, and a Leaflet on BASIC stuff.. I even changed the
"My Computer", and "Network Neighborhood" short cut icons.
Sounds like a little kid saying MIIIINNNNEEE--MY COMPUTER!!!! HI HI..
Network Neighborhood?--- I sure am glad that I do not live on that
block!
HI HI...
It is OK, and I guess Bill Gates thinks this will make the average
public feel MORE COMFTORABLE... Just like PLUG AND PLAY...OH YEH, WE all
have a lot of money to buy PLUG and PLAY hardware.. Just throw our old
stuff out, cause no one ever saves the papers that came with them, and
NOONE knows what all those little black jumpers are for, or what they
mean...
For me, it has taken the CONTROL out of how I, and not the PC, wants my
IRQ's set up, memory addresses, etc. I can still control it, but you
have to FOOL the plug and play feature.
I have code named it :: PLUG AND HOPE! You can only HOPE that your old
DOS hardware/Software will work right.
The COMPUTER KNOWS BEST?? Riigghhtt.
I am using WIN-95 though, because as a LAN/WAN Administrator, I have to
learn such new things, or RETIRE!
I am not as discusted as I sound, but I have been where you are, and
there is nowhere to turn... Have you ever tried to call Microsoft?
(Hit 1 for this, 2 for that, 3 for WHAT?, 4 to repeat..)
I feel they should either hire 1000 Tech Support Reps, or SEND A MANUAL
WITH THEIR PRODUCT!!
Win 95 is NOT ALL BAD, and has a LOT OF USEFUL Features, and am sure it
has secured a valid place in computing.
OK ENOUGH from me!
(Being 1/3 German, 1/3 Scotch, 1/3 IRISH--- It is hard being a Hard
Headed-Tight Wad-that NEVER GIVES UP!!!! HI HI..)

Icons become "Shortcuts", directories become "FOLDERS", the the key word
for every thing is "PROPERTIES".

(Windows 95 Resource Kit is the manual you need. Available as a seperate
item now) I do not have a resource kit yet, but will be getting one I
think.

Try this:
Go to "Start"
Then "SETTINGS"
Then "TASK BAR"
Then "ADVANCED"

```
Then "Find the short cut (ICON ) which you use to Start your APRS.
Then "Highlight it by clicking ONCE ONLY. (Twice will start it up-HI!)
Then "Hit your RIGHT MOUSE BUTTON" You will see several options show up.
Then "Select "PROPERTIES"
Then "Select "PROGRAM"
Then "Select "ADVANCED"
Then "Once you get here, look over your options"
Specify Conventional memory. I would think 485 or 500k would be OK.
Just leave the XMS EMS and others at "AUTO", or "NONE",

MAIN POINT!!
CHECK THE BOX THAT SAYS {"DOS APPLICATIONS IGNORE WINDOWS SETTINGS"}
Other than that, just keep trying to set different things up in that
PROPERTIES, PROGRAM, ADVANCED window.
        The other thing you did not mention is how much RAM memory you have?
Really, 16 Meg is about the minimum for WIN-95.
(I know they say 8-meg, but you end up waiting for the swap memory
writes to your HD all the time, not to mention the WEAR on your HD.)
Also when they specify 8-meg, they think you are running ALL WINDOWS
apps.
It really taxies the system, to run DOS apps through Windows. It did for
WINDOWS 3.1, and it still does for WIN-95.
Hope I have not TOTALY COMFUSED YOU!
GOOD LUCK!
And I know Mark and Keith are LAUGHING THEIR HEADS OFF now..
Take care De AAØMM, Ross
```

Thanks Keith and Mark;

I tried setting it up the same way as the U-2000, with the TNC in GPS
mode, but then APRSdos was mixing the BText in with the weather data.
I didn't think to check if WinAPRS was displaying it properly that
way. It was only after I failed, that I turned the page and saw the
U-500 had a paragraph directing a different set up than for the
U-2000.

I reread the U-500 manual and according to it, the U-500 organises
the serial output exactly the same as the U-2000. That would seem to
imply that I could set it up either way, but it didn't work out.

Since APRSdos is used almost exclusively in this area, I'll leave it
as it is, for now.

regards,
Joe kf4dys

GM All,
   I recently received an APRS cable from Kantronics that is supposed to allow
the use of the KPC-3 and a GPS 45 on a laptop with one com port. My problem
is the error message I get on startup:"Port failed to open." I tried the debug-
ging routine (shift key on startup). It tells me:
Serial Library "serthunk.dll" loaded OK
Calling SerialOpen
```

```
Returned from SerialOpen
 (TNC setup commands issued)
Calling SerialOpen
 (I see info received via radio at the bottom of screen)
Retturned from SerialOpen
```

When I hit OK to the last dialog box, The "port failed to open" box appears
and the program stops. Any ideas on this problem would be greatly appreciated.

If you are using Windows 3.1, the HSP support is not finished, I have to
update the SER16DLL.DLL file which I dont have done yet.

If you are using Win95, then you must have the new SERIAL32.DLL, look at
the INTERNAL STATE WINDOW, and it will tell you if HSP mode is available,
if you are using the old DLL, then it wont be available.

If this doent solve the problem, send me another message (private not to
the sig) with full details and I will look into it.

Mark

I saw a Magellen 2000 advertised by Kmart for $150 this past Sunday.
I don't know anything about this GPS. Is it a good one for APRS?

Unfortunately, that is a standard WINDOWS trap, and the data (address,
stack) is useless, I have tried to figure out stuff from it but its
impossible.

If you have a REPEATABLE crash, meaning that you can go thru a specific set
of actions and it crashes, PLEASE, send it to me (private, not to the SIG)
and I will try my best to figure out what is going on.

Mark

```

they see the handwriting on the wall and are emptying their warehouses? No
problem - right - except that it is being done through TRUCK STOPS (maybe
other places too). One of our members has been a ham for 8 years and is a
truck driver and comfirmed this as so. Just stop in and buy no questions
asked. That is why there is garbage on the air calling itself "The Ham From
Hell" and I am sure others turning the spectrum into what we all feared.
>

Non amateur radio sales is NOT anything new. I have seen CB'ers shacks that
would make most hams envious. And these are people who don't operate
anywhere but on the CB channels. This has been a very large market for
Amateur HF equipment for years. Boaters also buy these radios. They are much
cheaper than the legal marine SSB radios. A lot of SWL'ers buy Ham
tranciever rather than just recievers to do their listening and never hook
a mike up to them. After all, they are going to get their ticket 'one of
these days' All of the major manufacturers and retailers have made a large
part of their income on these Non-Ham sales. I doubt that we would have the
selection or prices on equipment that we have today if ONLY licensed
amateurs were able to buy these radios. The fact is that the Amateur
community is a rather small one and there would not be enough of a market to
attract the manufacturers attention if their sales were restricted to
licensed amateurs. Be careful of what you ask, you may get it and have to
suffer the consequences!

Anyway, Whats this have to do with APRS?

I think the 2000 has a built-in antenna with no provision for external
antenna. In my opinion, this makes it less-than-ideal for APRS.

Thanks for the DFjr tips about testing with a scope and not a VOM.
and adding a pre-amp to up the gain before closing in on the fox.

>The VOM is not a good way to test the antenna, a scope is,
>proper voltage swings need to be observed,
>as when we test before ship.

I am glad you reminded us of the problem of a momentary squirt
of xmit from some HT's . I have read about lots of 2.5 GHZ downconverters
fried by a single small bleep of RF.

>some HT's will transmit momentarily, just enough time to cause the damage.
>Receivers are recommended, ICOM, Yaseu, Kenwood, etc. not scanners, they
>are junk.

But a scanner is a good tool to use to test and help setup the DFjr.
It will keep you out of trouble as you learn to use the DF unit. It
will pull in station that are on 24 hr/day to allow late night
testing.

The scanner will work well to track strong signals like repeaters and
the NOAA weather stations.

The wide front end of a cheap scanner will give lots of intermod on
2 meters and as Joe said is not the best solution, but it does work.

You can also find some RS HTX-202 with blown finals at a sidewalk sale
and use them as receive only.
(a HTX-202 at 13.5+ volts outputs 8 to 9 watts and can get HOT !)

Rendered body type: text/plain

Today, I converted one of our existing digipeaters from a KPC-2 to a
KPC-3. The digi also runs APRSdos 7.7e. It uses the standard
INITTAPR.TNC file. One alias is WIDE, one is RELAY. The Unproto path is
APRS v WIDE. What happens is that the digi transmits and sees its own
packet. Therefore it also transmits it as a WIDE.

MXMIT is OFF (at least it says it is - doesn't act like it).
INTFACE is set to TERM. Things display correctly.

If I send a packet via WIDE,WIDE, the digi transmits it twice.

What am I missing?

To: APRSSig <aprssig@tapr.org>
Message-ID: <32B86812.AFC@wtp.net>
Rendered body type: text/plain

Greetings All,

I am starting to setup an APRS gateway station here
in south central Montana. I have tried running on HF for
several days and can hear many stations, but I doubt anyone
could hear me. My location is in a valley at the base of the
Beartooth Mountains (NE entrance to Yellowstone Park). I would
like to put up a remote WX and possibly VHF base up in the mountains
that will be useful during fire season but that will
have to wait until the summer. In the mean time I want to start
assembling the necessary stuff to make it all work.
So my immediate question is for those of you running
HF gateways on 30 meters (10,149.30 FSK). What antennas do you
use? Could I get away with using a vertical, possibly one for
mobile? How much power are you running?
Any station descriptions would be appreciated.
Thanks es 73, Chris / KF7KN

Yep- It is called a "Zero-Pressure" balloon and one was just launched a couple of months ago in Alabama. My Group, The Atlanta Balloonatics, was who recovered it once it got to Atlanta. Lots of times Bill Brown, WB8ELK, sends his balloons this way because he knows we have a lot of hunters here and that we heartily embrace APRS.

This particular balloon was going to float until commanded down. It looked like a 50 ft tall , limp dry cleaner's bag. Unfortunately the balloon tore on the first launch attempt and the hole reopened at about 37000 ft. Instead of floating for hours and being cut down here in my back yard (yes, Bill can really calculate them that closely) it went down on its own, but using APRS and the Directional Systems Doppler DF, we found it in minutes. Bill hopes the next one will have a very extended flight.

Hey- does anyone out West want to send one over here to us?

If you want to read more about it an=d see pictures, too- try the following web address:

http://fly.HiWAAY.net/~bbrown/halo5.htm

By the way, we organized the recovery team in a few hours- we had not been notified of the flight until 11:00 the night before.

More balloonatics info is at: http://www.mindspring.com/~rwf as are pictures of the Directional Systems DF unit we use.

Ralph

Helloto everyone on the sig. The name here is Josh located in Sheboygan Wisconsin. I have a problem with working DOS Aprs working on an 8088 system. The question is that when I start APRS on this computer I get a weird error, and the program won't load at all. I am running an 8088 with a black/white monitor with a Hercules video adapter. Does anyone know why it is doing this??? The main reason I want it to work on my 8088 is because I do not want to use the main computer which is a 486 for APRS all the time, and want to use the 8088 because it's main purpose is to use for packet and APRS.
If anyone has an answer to this problem will be appreciated!
Thanks.
73

APRSdos REPLY/COMMENT: Call KANTRONICS and speak to the boss.  THE KPC
needs to be able to IGNORE its own transmitted packets.  If you are uisng
an MFJ data radio or any other radio that hears its own transmissions,
then you will have this problem!  It needs to be fixed in the TNC...

Bill doesn't have any control over where they are going to land by the way. In
the future they may be alble to direct (Or pick) a landing site using a
controlable parasail that the Huntsville group is playing with. But the winds
aloft is going to take it where it want to. Also the balloon while being made
ready touched the ground and that's what ripped the hole in the balloon.

Yes this balloon would have gone right to the coast if there wouldn't have
leaked.

Most obvious legal "opinion" here is to compile mapfix to EXE form
and distribute that per the license agreement.  I know one who owns
the professional version of the above (Visual Basic for DOS) and has
already compiled it (and fixed a couple of bugs to boot!).
Distribution would be a snap!

574. NetScape for OS/2 Java Works

From: schiers@ames.net
Date: Wed, 18 Dec 96 19:06:30 -0600
To: aprssig@tapr.org
Message-ID: <199612190125.TAA12276@brain.ames.net>
Rendered body type: text/plain

```
The FINAL release (not a beta) of NS/2 for OS/2 Warp is
available. I have tested it at wa4dsy and at wb4apr. It
seems to work perfectly for both. This is REAL progress,
as the previous two betas didn't work at all for these
java sites.

The software can only be downloaded from your Warp icon
which says "Get Netscape Navigator". You will want to
download both nsos202.exe and plugpack.exe. Good instructions are provided
in the release notes. Read them BEFORE downloading the software.

Installation is pretty simple under Warp 4.0. There are some
strong caveats about Warp 3.0..it will work, but the install
is more complex.

Warnings:

You MUST uninstall either beta if present, BEFORE you install NS/2 FINAL
version. To do this:

Open an OS/2 window, change to the directory from which you
installed the NS/2 beta. Note: this is NOT the directory that  the NS/2
beta is installed in, but the temporary directory where the install files
are located. If you erased these files,
re-extract them to a temporary directory. From this temp
install directory issue the command: install /A:D  and follow the prompts
to select and uninstall the beta. In order to
process locked files a couple of re-boots are required during de-install
and install.

Installing NS/2 will overwrite some of your existing Warp 4.0 files. If
you are worried (or careful) copy them to another location before you
overwrite them. You are warned for each overwrite if you DO NOT select
"yes to all".
```

First install NS/2 Navigator, THEN install the PLUGPACK. Create a separate temporary directory for the NS/2 install files and the PLUGPACK install files. DO NOT USE SPACES in the directory names! I used nstmp and plugtmp and it worked fine.

Your Warp java will be updated to 1.02 by installing NS/2.

Initial Impressions:

1. NS/2 final release is MUCH faster than the betas. Maybe due to the debug code being removed?

2. All the java pages, even non-APRS that I have checked seem to work properly.

3. It's free...but be sure to register (from inside Netscape, choose help, register.)

4. Contrary to what the betas were like, JAVA is enabled by default. In the betas you had to turn java on or it didn't work.

If you are NOT using the IBM built in dialer (and very few of us are), you will have to highlight the NS/2 icon, then right click and go to "properties". In that screen you will see the main program call to be "Linkup.exe" and the argument "Netscape". This MUST be changed if you are using a dialer like In-Joy or any other non-IBM dialer. The change is simple: Replace Linkup. exe with Netscape.exe and delete netscape.exe from the argument window. If you fail to make this change, you will get a message saying you aren't connected to the internet, do you want to connect now?

My apologies to the sig, in that not that many people are necessarily running OS/2. However, those that are, will find this information very helpful and its purpose is to get those people access to the javaAPRS sites, which I find most intruiging.

Greetings all:
  We've changed the E-Systems APRS club station, k5qbm-2, to a WIDE. It seems to cover the Dallas area quite well and connects nicely with the Fort Worth WIDE, WA5YVC-11. It is currently a digi only; I'll install APRS over the holidays.

Please report any problems with the digi to myself AND Matt, aa5wh, at mthomas@whynet.

I know! I knw! Get back on topic!
Well, I use the KAM in my shack for APRS, so perhaps this isn't too
far off base. I have been experiencing some problems of late with my
1989 version KAM. It has taken to bouts of absolute jibberish (apart
from my seemingly endless drivel!) of late. I enjoy putting the KAM
on 10.149.0 (FSK) and monitoring the APRS there, so I was rather bummed
to have to go to the KPC-3 and VHF only.
        Well, will all the talk about Kantronics service, I thought I
would test the waters. I sent an email to the service department with
my dilema, and within 18 hours of sending the email, I had a reply
frm the service manager. Not only did he respond, but he gave me the
fix to my problem (the Dried Electrolytic cap syndrome spoken of here
so recently). I tried the fix, and presto! I am back to listening to
HF packets again.
        While I am *extremely* impressed with Gwynn's responsiveness
here on the sig, and when it comes time for me to up the bux for a
tracker TNC for Mama's car it will be a Pico, I think credit is due to
the Kantronics folks. They have come a long way in customer service.

Rendered body type: text/plain

One small problem with the Magellan 2000 gps, it has no NEMA out.

The 3000 can be interfaced for an additional $35, putting it around $235, an
external anntena can be added for about $110(E&B Marine prices). It
is externally identical to the 2000.

I've got one(3000) and am not thrilled with it. I use mine at work and it is
useless
at radio sites.

The problem with WinAPRS that i have run across is that you need 3
com ports
all on different IRQ's. You can't run the mouse on com1 and the wx on com3
if they are both sharing the same IRQ. I am hoping that this might help.   73

While we're on the subject of Weather Stations, any method of selectively
filtering out manually entered weather stations? If not would Bob and The
Sproul Bros consider adding this feature? We're trying to set up a reliable
weather info system for the Ham and NWS use. Some folks enter wx data

manually when the mood strikes them, so totally inacurate weather is reported
for extended periods.

APRS requires at minimum a CGA monitor or CGA emulation capability.

There is a program that is a number of years old called SIMCGA which will allow you to display CGA graphics on a Hercules Monitor. For a number of years I ran numerous CGA graphics applications using SIMCGA. Using SIMCGA I have successfully used APRS (several years ago and versions back) when I had an amber colored monitor and hercules graphics adaptor. I have since upgraded to a VGA monitor and am not sure if I have the simcga program anymore but I will look.

I bought the Garmin 45XL for $289.00. The Garman 45 was on sale for about $12.00 less. I also bought mine at a Boat store.

Just thought I would throw my $12.00 bucks worth in.

Try looking at the APRS serial ports settings, find the port the Garmin45 is on and set speed to 4800. Go to the Garmin and set the speed on it to 4800 as well, and set NMEA to 0183 1.5 Also check the TNC speed, using

ABAUD command set to 4800. Save everything and try it again. This should have the devices talking to each other at the same 4800 BAUD speed.
Hope this helps.

590. KPC-9612 PLUS, WestFest, For Sale

From: Mark Fellhauer <sparkfel@primenet.com>
Date: Thu, 19 Dec 1996 01:21:14 -0700 (MST)
To: aprssig@tapr.org
Message-ID: <1.5.4.16.19961219012120.36e705a6@mailhost.primenet.com>
Rendered body type: text/plain

This weekend I picked up the NEW KPC-9612 Plus at HRO Phoenix.

Although I've only sampled a small portion of the unit's capabilities, so far I'm very impressed.

According to the manual, The 9612 is being discontined, and the PLUS is replacing it. Major differences include a 3rd port option via an internal header. Kantronics "plans" to offer several add-on modems, including a KAM-Plus-like one. The 9612 PLUS also supports higher data rates--up to 38.4 Kbps on port 2. Analog pots for data drive and receive signal have been replaced with digital pots controlled via keyboard commands.

There is one other major difference in the PLUS, and this has uses for APRS, I believe. It offers two Analog to Digital inputs in addition to the two control line outputs of the original 9612.

Overall construction of the unit seems very good, the unit has a nice heft and a solid feel. Once again, Kantronics puts out a lackluster manual. The POCSAG encoder/decoder seems to work well in my base trials, and I plan more experimentation with Amateur Paging in the future. Perhaps paging will be supported in coming versions of APRS...

WestFest:

Once again I've been tapped by the ThunderBird (formerly Honeywell) ARC to chair the 2nd annual WestFest.
This should be the largest Hamfest held in the west valley (Metro Phoenix).
It was big last year, our first, and should be bigger this year.

WestFest will be held Saturday January 11, 1997
6 AM to 1 PM, Rain or Shine
Glendale Community College North Parking Lot
6000 West Olive Avenue
Glendale, AZ
Admission: FREE

Parking: $2.00 per vehicle
Tailgating: $5.00
Talk-ins: 145.43 (-) and 146.52 simplex

WestFest is sponsored by the Amateur Radio Council of Arizona (ARCA) and hosted by the ThunderBird ARC (TBARC)

VEC Testing
Sell/Trade/Swap
Commercial Vendors
Food & Beverages

The NWS/SKYWARN people will have a table there, and may put on an audio visual program.

I hope to have a LIVE APRS DEMO STATION running at WestFest, complete with an auto-tracker mounted on my bicycle. Although my gell-cell just died, and I just spent my discretionary funds for the next month or so on that 9612 PLUS!

For Sale:

One Dauphin DTR-1 Palmtop 486 SLC-25
Under 3 pounds and very small
VGA mono electroluminescent 6" diag display onboard (1 meg OAK video card w/external SVGA port)
Runs Windows 3.x with pen extensions well
40 meg hard drive (double spaced to 80)
6 megs RAM
Math-Coprocessor
Built-in ethernet connection
Built-in 2400/9600 data/fax modem
9 pin RS-232 port
25 pin bi-directional parallel port
Two-button stylus
User-rebuildable Battery
RUNS OFF 12 VOLTS DC DIRECTLY, no messy adaptors required.
Made by IBM for US Military
Was $3000 in 1994
Leather Carry case
All boxes, software, and manuals
External Floppy Drive
Great for APRS and portable packet

First $670.00 takes it. Price includes shipping to contiguous 48 US States. The only reason I'm selling it is bacuase I was given a Gateway Handbook 486, and I can't justify having two subnotebook computers.

One PacComm Spirit-2 TNC. A very nice high speed TNC. TNC-2 type modem disconnect header supports 1200 and 2400 Bps. Best Offer takes it.

73, and see you at WestFest

Mark

Subject: [APRSSIG:7451] Re: Peet Bros. U-500

While we're on the subject of Weather Stations, any method of selectively
filtering out manually entered weather stations? If not would Bob and The
Sproul Bros consider adding this feature? We're trying to set up a reliable
weather info system for the Ham and NWS use. Some folks enter wx data
manually when the mood strikes them, so totally inacurate weather is reported
for extended periods.

de KF4COH
Ken in Jax

Ken:
I think your statement above about manual wx entry is totally
incorrect. I run a manual station here simpy because I cannot afford
the price of a wx station. For your info I will put my wx
observations and manual entries up against any auto wx system. I
do not enter wx data when the mood strikes me either. I run a
constant wx station here manually except during the hours which I
sleep. My system runs 24 hrs per day. I am the only wx station in
Northern Ontario that is on Aprs and WinAprs. I am sure there are
many others out there as well.

Merry Christmas to you and everyone else. May your holiday season be
a safe and enjoyable one. 73..........

I happen to know a GPS manufacturer in Kansas who would be willing to
donate a GPS receiver for a project of benefit to so many amateurs.
I would need to know what type of receiver is preferred---a hand-held
or a board one? The antenna---does the balloon shade satellite
reception directly overhead, or is that negligible?

I can be reached at: n0lrf@amsat.org

<< steved@vianet.on.ca >>

Steve:

Unfortunately you may be a rarity. While there are many dedicated hams updating weather frequently, that is not always the case.

We are trying to establish a reliable system to enhance SKYWARN, NWS etc. Now that we have invested in numerous automatic weather stations, a few hams like to jump in an enter a weather entry every once in a while, however they fail to update them. When every automatic station is showing 32 degrees and the maunal stations are showing 45 degress because they've all gone to bed, what is to be believed? This undermines the accuracy of the entire system.

The ability to either filter out or time out a weather entry will enhance the accuracy of weather reporting and thus the utility of APRS.

And Merry Christmas to and all the others on the SIG.

601. Peet Bros. U-500 & KPC-3 setup

From: joefoor@digitalexp.com (Foor, Joe)
Date: Thu, 19 Dec 1996 10:04:13 -0600
To: BordingK@aol.com
Cc: nflaprs@lwcomm.com, aprs-fl@tapr.org, aprssig@tapr.org
Message-ID: <32B9677D.2222@digitalexp.com>
Rendered body type: text/plain

Hi Ken;

Here is the setup that I used to get the WX station on the air.

WIRING IT UP

I had purchased the DATA LOGGING option, so I have a serial cable
with a db9 adaptor, rather than the db25 described in the APRSdos
text file. The adapter I built, for between the U-500's serial cable
and the KPC-3, connects three lines.

```
     KPC-3    U-500
     db25      db9
       1--------5      ground
       2--------2      data from U-500 to KPC-3 TXD
       3--------3      KPC-3 RXD
```

The RXD connection may not be necessary, however, an oscilloscope
showed some signal on this, so I hooked it up.

The APRSdos file says that the U-2000, with db25 connector, also
requires a biasing resistor. Since the U-500 manual implies that the
serial port is identical with the U-2000, I tried installing a 4.7K
resistor and found that it messed up the data flow, causing the
KPC-3 to stay in transmit, once it keyed up from the first data
line. With no resistor at all, it works fine.

KPC-3 PROGRAMMING

The biggest stumbling block, is the wrong command instruction in the
APRSdos text document. The document gives you $10 for SENDPAC and it
should be $0A. The KPC-3 wants the Hex code, but the document tells
you the Decimal code.

Here's the whole thing:

```
   INTFACE terminal
   CR off
   SENDPAC $0A
   PMODE converse
   ECHO off (may not be necessary)
```

U-500 PROGRAMMING

The U-500 setup is complicated by the directions to press two
buttons simultaneously. Since this is not possible for human
fingers... I found that pressing the wrong button first will not put
you in PACKET mode.

The U-500 is set to PACKET data mode by:

   Press and hold the -0- button, then press and hold the windchill
   button. The display will flash three times and stabilize again.
   Release both buttons.

NOTES

I had previously used this KPC-3 for Packet, APRSdos, WinAPRS and
most recently for stand-alone GPS. As far as I could tell, the only
other command that was affecting the remote WX operation, was the
GPS LT transmissions. I cleared this by setting LTP 1 to NONE and
BLT 1 to 00:00:00.

My KPC-3 has version 6.0 firmware, which includes the PMODE command.
I don't know how you would get the KPC-3 to power up in the CONVERSE
mode, with earlier versions.

regards,
Joe kf4dys

OR have WX older than 30 min be displayed in a different color.

Bob, fade to grey has nothing to do with it. If a user enters the weather
setting and transmits every 15 minutes it will NEVER fade to grey but the
WX VALUES may be 10 hours old.

In the current release of WinAPRS, there is an option for station display
mode, if you turn WEATHER STATIONS ONLY on, you automatically get this.
What it does is show you the station, callsign, TEMP, RAIN, WIND, BARO, and
! ! AGE ! !, this tells you how old the PACKET its, I have seen weather
stations that I have not heard from in a few hours so this shows you the
age from the last time wx was heard, that of course does not mean from the
last time they intered the data. I will work to enhance this, maybe show
manual WX entries in a different color or something else.

I have been running hf aprs off and on for 2 days now only
monitoring and not broadcasting my position. I thought hf aprs was
10149.50 khz lsb, but all the stations I hear are on 10151.46 khz
lsb. Since this is outside of the 30 meter band I thought my icom 736
was out of calibration, but I tuned my drake R 8 to receive the
signals on the same frequency 10151.46 khz. Could someone explain to
me what is happening. I can't imagine this many station being out of
band so there must be a reason for this happening. 73

When every automatic station is showing 32 degrees and the maunal stations are showing 45 degress because they've all gone to bed, what is to be believed? This undermines the accuracy of the entire system.

The ability to either filter out or time out a weather entry will enhance the accuracy of weather reporting and thus the utility of APRS.

608. Re: [APRSSIG:7464] Balloons...

From: clark@tomcat.gsfc.nasa.gov (Tom Clark -- W3IWI)
Date: Thu, 19 Dec 96 18:34:12 UTC
To: aprssig@tapr.org
Message-ID: <11816@tomcat.gsfc.nasa.gov>
Rendered body type: text/plain

Regarding ballooning with GPS: Be very careful that you know the characteristics of the GPS receiver! Be especially watchful that you know that the receiver will work at altitudes above 60,000 ft.

The reason for this specific warning is that all GPS receivers sold for commercial usage have to comply with COCONM Export laws. These state that, without specific government approval, no GPS receivers that can operate at altitudes above 60,000 ft and at speeds greater than Mach 1.5 can be sold (I believe it it Mach 1.5 -- I don't recall the precise speed in the law).

Some receiver manufacturers have interpreted this rule in their firmware to be 60,000 ft >>OR<< Mach 1.5 and they literally reset themselves when they pass thru the 60kft level regardless of speed (the Trimble OEM receivers are one example -- they begin reporting Sunnyvale CA as the position when they hit 60kft).

Other receiver manufacturers (Motorolas made since 1994 and Rockwell) take a different approach. Either they have only a speed limit or they do the grammatically/logically proper test on speed+altitude. And these receivers will work fine in a balloon.

I don't know which other manufacturers are suitable. Before you fly a ballon-borne GPS receiver, I strongly advise that you do at least one of three things:

1. Verify with the manufacturer or with folks who may have flown the same receiver already that it will function above 60,000 ft.
2. "Fly" the receiver on a GPS simulator to verify that there are no problems at high altitude.
3. Be willing to sacrifice the balloon experiment in case the receiver has unexpected COCOM restrictions.

By the way, the common name for the COCOM rule is the "Anti-SCUD" rule. The reason for its existence should be obvious to all!

609. Re: [APRSSIG:7471] Peet Bros. U-500 & KPC-3 setup

From: clark@tomcat.gsfc.nasa.gov (Tom Clark -- W3IWI)
Date: Thu, 19 Dec 96 18:49:08 UTC
To: aprssig@tapr.org
Message-ID: <11818@tomcat.gsfc.nasa.gov>
Rendered body type: text/plain

Joe, KF4DS commented on his cable adaptor:

```
>      KPC-3    U-500
>      db25      db9
>        1--------5      ground
>        2--------2      data from U-500 to KPC-3 TXD
>        3--------3      KPC-3 RXD
```

I would like to note that on a DB25 RS232 connector Pin 7 is the signal ground pin, NOT pin 1! On the 25-pin connector, Pin 1 is supposed to be "frame ground" and is normally used to provide a safety ground and as a termination for the shield on shielded cables. In most units you are NOT guaranteed that Pin 1 will be the proper common return for RS232 signals.

>Land Line 510-223-7156
>elewis@dsp.com

If you are going to transmit 10.151 lsb you are fine.
I transmit 10.147 usb and it is fine. Packet does not care whether it is
lsb or usb. The key is to be on the right frequency. Since my radio
refuses to transmit above 10.150, I can't run lsb.

The important point is that because of the tones you are transmitting, the
actual frequency from the dial is lower if LSB and higher if USB, hence
the two frequencies mentioned. No one is transmitting outside the band. If
it makes you feel better, tune in the aprs network on 10.147 USB...I'm
there with the rest of the network.

As simply as I can put it, even though those running LSB have a dial
reading of 10.151 or so, and those of us running USB have a dial reading
10.147 or so...we are all on the "SAME" frequency, which is just inside
the top end of the 30m band around 10.149. Assuming you are running 2200
hz tones, transmitting on USB 10.147, your actual frequency is 10.147 + 2
khz = 10.149. ON the "flip" side of things (pun intended), If you are also
running 2200 hz tones, and transmitting LSB on 10.151, your actual
frequency is 10.151 - 2 khz = 10.149...Presto! All is well ....and
perfectly legal.

Hope this helps. 73,

hasan schiers, N0AN--

  Works great. I use it to load linux and once in a while dos, windawg95
and NT. You can also use it to hide partitions from other operating
systems which may be destructive, like win95.

Rendered body type: text/plain

```
If you have several stations out there that are automatic wx and one or
two that are not, it would be very obvious if the manual station is
keeping current. This is a given. If your concerned about the accuracy of
the data, then you have to look at the time stamp as Bob mentioned.

I suggested, that they add a "time out" routine to the program. Say, if
you enter the data manually that the programs halts wx data transmitting
after 30 mins or so. Have it delete the data from all other stations,
like it does with deleting objects. I'd also suggest that the "time out"
be use adjustable. Set that up in the config file on the front end for
dosAPRS and a varible in WX window in winAPRS.

Keep in mind, that although a station has an auto wx setup, they may want
to manually enter data in a storm situation. Rather than wait for the
next scheduled wx beacon. This would be equally important. As a matter of
fact, why have the manually data beacon more than once? Enter the data,
and send it as a burst, follow 30 mins later with an erase.......hmmmmm.

If its skywarn that your mostly concerned about, then the wx data at
```

QTH's will most likey be manually entered and most definately if a spotter is working it mobile. Of course your remote stations don't matter anyway they are going to send the data on a regular schedule. Which brings up a question, if I have a remote wx monitoring station out there and want to get up to date info, can I parse that and get it or do I have to wait for the beacon?

Chew on that a while....................

Dane County ARES is currently setting up a Weather APRS base Meso Net within Dane County. We currently have 9 sites that we can start putting up stations. Not only would the Meso Net be used for Skywarn, but would be very helpfull in Hazmats.

The station specs are:

Davis U-2000
MFJ APRS Data radio
MFC TNC
Deep Cycle battery with trickle charge.

We are looking into a source of funding for this. Each station will run about $1000. If anyone knows of a souce of funding for this, I would love to hear from you. Or if you have any comment, let me know.

Tom Fleming - N9SZF

The WX info just keeps getting transmitted at normal intervals as a
regular beacon. It matters not when it was inputted. So the fade-to-grey
never gets a chance to work. (I'm talking about *manually* entered WX info)

Tom:

Have you talked with anyone at the NWS about this?  I've heard some
rumors around here that Federal money might become available to fund
automatic WX stations just as you've described.  As you know, NOAA has
closed down many of the smaller offices, so they now depend on
volunteers more than ever to supply local observations.  Of course, APRS
would lend itself very nicely to this purpose if the information is
accurate.  I will try to make some calls in the next few weeks and see
what I can find out from the local (PHL) office.

Try building a batch file to start APRS and include this line *before*
executing APRS.

set comspec=command.com

(use the appropriate path for command.com if it's not in c:\)

I had the same problem because I use 4DOS.COM and APRS would not shell to
DOS using that command processor for some reason.  You can reset comspec
after APRS if that's your situation.  As in:

set comspec=c:\dos\command.com
APRS
set comspec=c:\4dos.com

Edward-

There's a full explanation right in the HF.TXT fine in the DosAPRS README
subdirectory.
10.151 LSB is inside the Ham band when you use KAM tones.  There's a lot of
other great HF packet in there too. Give it a look.

Well, the temperature has dipped in the teens and lower 20's for the last
couple of days here in Middle Tennesee. I have noticed that my GPS45 I left
running with my tracker in the car has turned itself off. I will start it up
again but after about 10 minutes it turns itself off again for lack of a
satellite fix. If I put the GPS45 where hot air can blow in it it will finally
lock on and start working again. The owners manual states that the operating
temperature range is down to 5 deg. F. We have not got there yet. Has anybody
else seen this phenomenon? Do I have a defective unit?

Bruce

I'm running APRSdos 7.7 with dos 6.22 and have experienced the same
problem.
I discovered that the problem was related to the dos virus monitoring
software
VSAFE tsr.  When I unloaded vsafe, the problem disappeared.
Since then I've loaded (actually MEMMAKER loaded) vsafe into high memory
and the problem no longer exists.  Hope this helps.

From: Philip Chien <kc4yer@amsat.org>
```

To: amsat-bb@amsat.org
Subject: Re: EASY SATS and APRS

Bob Bruninga <bruninga@nadn.navy.mil> tried to unload a bunch of propaganda and crap on top of us when he said:

>WIth larger numbers of stations today, something similar only requiring
>ONE successful UI packet with a gridsquare and brag info would accomplish
>even more with a lot less congestion...   I.E. APRS.
>
>Please this is not meant to PUSH APRS

to put it as sucinctly as possible ---- BULL SHIT!

... It is meant to push A STANDARD
>AMSAT POSITION/STATUS PROTOCOL what ever it might be. But you can be sure
>that APRtrak will be modified to receive and plot it on the map whatever
>it is...

Bob claims that he is not trying to push APRS, and promptly states his defintion of "A standard AMSAT position/status protocol" (his words) which happens to exactly fit APRS's definition.

WHAT KINDS OF FOOLS DO YOU THINK WE ARE????????

Bob tried to accuse me of censoring a discussion because of my professional job, when in fact I was trying to encourage discussion about an impractical concept. (vis my message "An open challenge to Peter Vekinis about Picosats - was EZ-SAT" dated Tue, 10 Dec 1996 18:41:04 -0500.)

When challenged Bob claimed that he didn't realize that I was specifically talking about Peter Vekinis's Picosat "proposal" -- which was mentioned in both the title of my message and the body of the text.

WHAT KINDS OF FOOLS DO YOU THINK WE ARE????????

Bob gave me a copy of APRtrak at a technical symposium in 1993 and tried it out. I wasn't impressed (my opinion). For satellites in fixed orbits it's basically redundant - enter one waypoint and the rest follows Newton's laws. For ground applications I'm not too impressed with just seeing folks report their locations.

There have been a couple of extremely unusual applications which I have encountered in the past couple of years where I feel APRS would have been useful, and even desirable for the ham radio and education communities, but I have not suggested the use of APRS because I am SO SICK AND TIRED OF THE APRS CROWD (read: Bob) TRYING TO SHOVE IT DOWN MY THROAT.

If Bob wasn't so adamant about insisting that everybody using his system, didn't make such stupid and unsupportable claims about APRS's wonderful capabilities, and wasn't so derogatory in his comments about people who do not want to use APRS I would have made those recommendations. And I regret that one of those opportunities has been lost completely (using APRS to report the locations of transmitters bouncing signals off the Inflatable Antenna Experiment) and I the other two won't happen because I refuse to encourage his unconstructive attitude.

I tried to use APRStrak during the one space mission where it was the officially sanctioned operating mode - the SPRE experiment on STS-72 and found the software to be extremely clumsy and unforgiving. Among other things, the software immediately started transmitting when it was started -- if I had a transceiver which started transmitting when I applied power I'd return it to the factory for repairs! The software had to be updated just before the mission began due to a bug -- and incorrect information which was disemenated about a fudge to fix a bug with East longitudes. (vis Bob's message titled "APRtrak E.long OK!", dated Mon, 15 Jan 1996 02:23:47 -0500 (EST). Better software testing ahead of time would have caught those, and other problems, but that's neither here or there. In any case I would not consider such an unusable piece of software something to develop a standard around.

During the STS-78 SAREX flight the astronauts were permitted to put the SAREX robot in to digipeat mode. That was the sole "authorization" of APRS operation. APRS was not supported by the SAREX customer support room in any other manner.

Neverthless in Bob Bruniga's paper "APRS SAREX Experiment on STS-78" (Proceedings of the AMSAT-NA 14th Space Symposium and AMSAT Annual Meeting) Bob goes on to claim that APRS was a succes.

Let's look at that claim a bit more closely. Nobody was told not to use APRS for STS-78. So Bob surely can't try to state that somebody was trying to sabotage APRS on that flight.

As Bob notes in his paper "18 stations were successfully reported via SAREX as part of the APRtrak/APRS experiment". And later states "A total of 65 APRS packets were received". He goes on to list the known (e.g. reported as trying) APRS stations which couldn't get through.

This is in comparison with the total 1357 connects registered by the SAREX packet robot. Hmm, I'd say that a whole bunch more people were successful getting through via "dumb terminal technology the same way we've been doing it for 10 years" (quote from the paper - and just one of many derogatory comments Bob has made about SAREX -- apparently with the logic that if somebody doesn't automatically think you're product is the best thing since sliced bread browbeat and insult them in to submission).

But I guess the 1357 folks who did get conencts learned math from a different place than Bob.

In Bob Bruniga's very questionable conclusions he states "had no adverse impact on the normal SAREX packet activity and should be encouraged on all future SAREX packet experiments" Which completely ignores the fact that there were APRS stations which made multiple contacts, and others which included messages in their status text - packet time which took away potential opportunities for others to get through to the shuttle.

Let's look at SPRE, where APRS was the only authorized form of communications. SPRE has a figure dedicated to it in Bob's paper, but no log of successful contacts listed in the paper. During the two passes where SPRE was in operation a total of 60 worldwide contacts were reported. Hmm, that works out to only once every 19 minutes! Okay, let's only look at the two continental U.S. passes where the majority of hams who were attempting to reach SPRE with APRS were located. Hmm, that's still less than one tenth the contact rate with the SAREX packet robot on a typical shuttle mission ... So much for the claims that APRS increases the number of people who can get through or that it would eliminate frustrations from unsuccessful contacts.

I do agree with Bob that SAREX contacts should only require a single contact instead of a multi-step process (hence my references only to the connects), and this is the attitude of the SAREX team. And will note that a packet protocol which *just* sends up the call sign to the shuttle, and returns a serial number, would take up even less packet time than an APRS contact since it would include less characters.

And APRS could only be viable within the EZ-Sat definition if the APRS community was willing to give (for free) a GPS receiver, AX.25 modem, and terminal to each person in the world which doesn't have any of those pieces of hardware. Otherwise it is in direct contradiction to the EZ-Sat progras goals -- to give ANYBODY with a 2 meter mobile radio and magmount antenna the capability to access a satellite.

So I wonder why Bob Bruniga claims that APRS is a viable protocol for EZ-Sats, space station, or SAREX.

WHAT KINDS OF FOOLS DO YOU THINK WE ARE????????

but I repeat myself ...

Hi Mapmakers,

I've already got a fairly decent idea on how to use MK100K3. and MAPFIX28 but haven't yet figured out what to do with the results of these efforts. I made some maps, but have absolutely NO idea how to go about making a maplist! I'm pretty sure the format is as follows:

Mapname.map,90.00,180.00,512

where 90.00 is the map center in LATitude, 180.00 is it's LONgitude and 512 is the scale at which the map will first appear. I also understand that smaller scale maps must be lower on the list than the larger ones. To this end I tried "grafting" my new entires into an existing, appropriate maplist to no avail. Yes, I did make sure there were less than 160 maps in that maplist and they were at the bottom (it was one of Bob's APRS DISTRO maplists, so all the maps were 32-milers and mine are smaller.)

Where am I going wrong? Hopefully I'll get this solved soon so I can give you all a little Christmas Present on the TAPR site. Just a little something I've been whipping up. Tnx & 73 (And, for all the traffic handlers, ARL Sixty One!)

Hi Everybody,
I have an operator question on this subject.
If you are using WinAPRS, and in the dialog box, where you state your
report time's. (I can not remember which one it is, but think it is in
the "SETTINGS", "APRS" pref's)
There is a TIME setting for HF,VHF, and WX.. NOW,, if you set the one
for WX to "0", the manual WX entry should not retransmit. IS THIS
CORRECT?
Else wise, for Manual WX reporting, you go into the WX window, and type
in the wx values. I thought that they just sit there, until you SEND the
WX. As long as the above TIME setting is set to "0" it should not
retransmit over and over.
Then the next time you want to manually SEND WX, you would need to go
into the WX window, and change your WX values to current values.
It makes no sense to me to send a MANUAL WX more than once.
Please correct me if I have missed something here..About WX being

```
retransmitted over and over again with OLD Wx Data manually entered.
Tnx... De Ross.
```

```
My appologies to the AMSAT-BB, but Philip Chien's comments need a little
moderation...

> In his unending attempts to see just how gullible the AMSAT-BB community
> is, Bob Bruniga said "There were only 10 stations seriously attempting
> APRS, and 29 others who tried occassionally...
>
> Considering the very very small number of people particpating - I've got
> to question why my tax dollars were spent (and lots of them) to support
> this experiment.  If your figures are true.  10???????

COMMENT:  Everyone in the world with a TNC was invited to participate.
Numerous postings were made on AMSAT-BB and anywhere else the students
could think of...  and lots more got to SEE the packets..
>
> .....  How much government money (read: your tax dollars) was spent to
> develop and fly SPRE instead of another candidate payload which would have
> had more educational impact  ....  You know, it would be pretty bad if
> the media got a hold of this information.  Whoops - too late.

COMMENT:  The primary mission of SPRE was to provide a telemetry downlink
for the GPS system flown on the SPARTAN payload... Students at UMD saw the
opportunity to use the TELEMETRY and GPS capabilities built into the APRS
protocol rather than re-inventing a new wheel.  But since the telemetry
was only needed every several seconds, they thought why not let HAMS world
wide use the TNC as a digipeater the rest of the time...
>
> Chien continues: According to the SPRE preflight publicity... they tried
> to encourage as many hams as possible to download the software and attempt
> contacts.... If only 10 were serious and 29 others tried occasionally

> yourself.  Where does the 1% figure come from?????  Are there even 6000
> hams who have AX.25 packet modems and use them to attempt to contact the
> shuttle - seriously or occasionally???

COMMENT:  In my paper and here, I try to avoid any comparisons because
there is NO DATA on conventional SAREX attempts.  You keep trying to force
me into numbers where there aren't any... and then criticize any attempts
to guess.  I have heard estimates of 10,000 or more per pass, but I
cannot and will not make any comparison because NO ONE KNOWS.  But gather
any 100 hams together after STS-78 and ask them how many attempted SAREX
and use your best judgment.  It would not surprise me if at least 1 had
tried..  TEN years ago the number of TNC's had passed over 100,000 and
the figure was doubling every year...  Most of us with our 10 mile radio
horizon (one ten-thousandth of the USA) find it hard to grasp the fact
that the Shuttle hears 10,000 times more people on the uplink than we do.

> >Chien continues:.....  Okay, let's only look  at the  two continental

> >Compare on a per-pass basis and you get comparable success rates....
>
> Chien responds:  WHO ARE YOU TRYING TO KID????   I said "typical"
> mission - and did not specify any mission duration.

APR COMMENT:  Still, you are comparing 2 passes to whole-mission counts...
and you had just finished 5 pages of complaining about the STS-78 mission.
>
> Chien: QUIT TRYING TO MAINPULATE STATISTICS AND CLAIM FACTS WHERE NONE

Rendered body type: text/plain

The APRS Grid Square reporting format was suggested for effecient use on SAREX and other AMSAT Easy-Sats since it was human readable, only took 3 bytes of overhead, and could be used by stations even without a computer..

But the new APRS Mic-Encoder format (currently in TAPR beta test) is even better. It includes in a 0.3 second packet burst on the tail end of a voice transmission, the stations exact position, his course and speed, and 1 of 7 pre-planned messages. All in a standard AX.25 packet receivable by ANY TNC in only 7 bytes of overhead. (plus 6 more bytes if the optional 5 channels of telemetry are included...)

Planners of future amateur communications satellites might find it useful to consider the potential of such capabilities... for HAMS on the move... or small telemetry tasks...(Picosats)

On Thu, 19 Dec 1996, Philip Chien wrote:

There are four WinAPRS maps covering the San Bernardino/Barstow area that were
uploaded to the FTP server a couple of days ago. The person who uploaded them
needs to know that these maps don't work on MacAPRS, but for some strange
reason are ok on WinAPRS. The fact that they were raw binaries and not ZIP'ed
or otherwise encapsulated might be a factor.

So... could you please ZIP the maps and re-upload 'em? Thanks!

Well, the temperature has dipped in the teens and lower 20's for the last couple of days here in Middle Tennessee. I have noticed that my GPS45 I left running with my tracker in the car has turned itself off. I will start it up again but after about 10 minutes it turns itself off again for lack of a satellite fix. If I put the GPS45 where hot air can blow in it it will finally lock on and start working again. The owners manual states that the operating temperature range is down to 5 deg. F. We have not got there yet. Has anybody else seen this phenomenon? Do I have a defective unit?

Bruce

What is their fargin propblem? Why is there so much resistance to APRS?

I mean many corporations have embraced the technology, but I know several hams and others who flinch when I show them this stuff. I guess they're worried about the Orwellian aspects of the technology or something.

I even had a hard time convincing Len Winkler, KB7LPW, the host of the nationally syndicated "Ham Radio & More" show about the utility of APRS.

I would like to join AMSAT, BUT if this is their position, I find that impossible.

Here was my reply to Philip Chien trying to address only the facts...
-----------
On Wed, 18 Dec 1996, Philip Chien lambasted APRS, but some of the
more obvious oversights in his meandering attack need addressing:

> As Bob notes in his paper "18 stations were successfully reported via SAREX
> as part of the APRtrak/APRS experiment"....
> This is in comparison with the total 1357 connects registered by the SAREX
> packet robot.
>
> But I guess the 1357 folks who did get conencts learned math from a
> different place than Bob.

COMMENT:  Read the paper.  There were only 10 stations seriously
attempting APRS, and 29 others who tried occassionally, many only once on
passes not even optimal for their location (all in the USA).  With 65
successful packets from 18 different stations you get a feel for the
numbers.  Now trying to compare that to the 1357 successful conventional
SAREX QSO's is imposible because no one has any idea how many HAMS
worldwide tried it the conventional CONNECTED way...  I admit, I dont have
a clue...   Lets try this:

    Of the 1357, lets say that only 1000 were in the USA (remember, anyone
in a less densely populated area of the world will see little congestion
and will certainly see better success rates..)

    If say 1% of the 600,000 HAMS in the US alone made any attempt,
then you get about 6,000 people trying with 1000 successes but who knows?

Anyway, in my paper, I made no attempt at comparison other than to
conclude that APRS was successful because 65 little Icons and associated
text were relayed via SAREX successfully to the joy of the participants.
It seemed that the success rate was in the same ballpark as the SAREX
rate. I further concluded that if success was measured by getting one
packet digipeated through SAREX instead of a total of 5 per station as
presently required using the CONNECTED protocol, that the overall success
rate for everyone would be much higher..  My math teacher tells me that 1
packet is smaller and consumes less bandwidth than 5.  Nothing more...
```

> In Bob Bruniga's very questionable conclusions he states "had no adverse
> impact on the normal SAREX packet activity and should be encouraged on all
> future SAREX packet experiments" Which completely ignores the fact that
> there were APRS stations which made multiple contacts, and others which
> included messages in their status text - packet time which took away
> potential opportunities for others to get through to the shuttle.

Count the total packets. APRS stations only transmit a few packets per pass compared to continuous uncontrollable CONNECT requests from 6000 other stations... Ten packets per attempt. I concluded that 65 APRS packets from 18 people over a 2 week mission is still a very small number and probably had no impact on the SAREX mission.

Chien continues: Let's look at SPRE, where APRS was the only authorized
> form of communications.... During the two passes where SPRE was in
> operation a total of 60 worldwide contacts were reported.... Hmm, that
> works out to only once every 19 minutes! Okay, let's only look at the
> two continental U.S. passes ... Hmm, that's still less than one tenth
> the contact rate with the SAREX packet robot on a typical shuttle
> mission ... So much for the claims that APRS increases the number of
> people who can get through or that it would eliminate frustrations from
> unsuccessful contacts.

REPLY. You are comparing 2 passes that occurred between 0100 and 0500 AM mostly over the Gulf and Atlantic ocean, with a 2 WEEK shuttle mission with 25 packet passes over the USA during waking hours. Compare the two on a per pass basis and you get comparable success rates. Further, the 60 successes are for only 66 people trying. Yielding a 91% success rate.

> I do agree with Bob that SAREX contacts should only require a single
> contact instead of a multi-step process (hence my references only to the
> connects), and this is the attitude of the SAREX team. And will note that
> a packet protocol which *just* sends up the call sign to the shuttle, and
> returns a serial number, would take up even less packet time than an APRS
> contact since it would include less characters.

REPLY: The APRS overhead is only 3 bytes. I would rather see little station ICONS pop up on my map showing the location of the stations and what kind of station they were running and some possible additional text rather than bland serial numbers on a blue screen...

> So I wonder why Bob Bruniga claims that APRS is a viable protocol for

If you're going to have different types of wx reports, why not assign different default timeout values, and allow users to change them independently?
Perhaps automated reports should die faster regardless of where they are being applied since you expect them to update regurlarly anyhow, and use your suggested default of 30 min for manual reports. (I'm sure somebody will WANT to see a five-hour-old report, so why not let them?) Or how about having the station SENDING the manual reports stop after the die time unless updated? That way it will go away everywhere...

>What about making 30 min a default, but allowing die period to be
>selectable by station id? This would allow users to make their own
>decision about particular manual stations.
>

Allowinmg each user to specify the "die" period of each MANUAL WX station on the screen is both tedious for the user and A REAL PAIN to program. Implementing a EXPERATION TIME of say 30 minutes or an hour for the TRANSMITTING station is easy.

What I expect to do is when a person inputs manual WX data, transmit it as is done now and continue to transmit at what ever WX XMIT rate the user has set up to 30 minutes or an hour. After that, the TRANSMITTING station will no longer output the WX data. It will continue to output other APRS data but NOT WX data. If the user goes in and updates the WX data, the timers are reset and it CONTINUES to output.

On the WinAPRS WX display option, you see the wx data, i.e. temp, rain, etc. But you ALSO see the AGE of the WX data, I was playing last night and there was some WX data that was 70 hours old (not very useful) but the display TOLD me it was 70 hours old I can then ignore it if I want. It happened to be a station in Peurto Rico so given the location, it was still some what useful, Had it been in NJ, were the averate temp has droped 30 over the last 70 hours it would have not been usefull.

Anyway, the above is what is planned for Mac/WinAPRS.

Mark

I downloaded these maps to take a look at them.  All 3 of them
VICTORVI.map, BIG_BEAR.map, and NEWBERRY.map (I hope these are the ones you
refered to since you did not specify) have some data at the end missing or
else the header is messed up.  There is less points then the header says
there is.  Possibly the files got truncated when they were uploaded.

I have fixed MacAPRS and WinAPRS to handle this situation and report the
error but it then goes ahead and reads the map anyway.

While fixing the old WX report problem after 30 mins, I decided to just change the station ICON from a WX station to a DOT. THis way the station is NOT killed but he still stays on the map. Since his ICON is no longer WX, then it is ignored in all WX stuff. But his old WX stays there in his station posit if anyone is interested...

To: aprssig@tapr.org
Message-ID: <199612202018.PAA28785@mail-e2b.gnn.com>
Rendered body type: text/plain

Hi Mapmakers,

I've already got a fairly decent idea on how to use MK100K3. and MAPFIX28 but haven't yet figured out what to do with the results of these efforts. I made some maps, but have absolutely NO idea how to go about making a maplist! I'm pretty sure the format is as follows:

Mapname.map,90.00,180.00,512

where 90.00 is the map center in LATitude, 180.00 is it's LONgitude and 512 is the scale at which the map will first appear. I also understand that smaller scale maps must be lower on the list than the larger ones. To this end I tried "grafting" my new entires into an existing, appropriate maplist to no avail. Yes, I did make sure there were less than 160 maps in that maplist and they were at the bottom (it was one of Bob's APRS DISTRO maplists, so all the maps were 32-milers and mine are smaller.)

Where am I going wrong? Hopefully I'll get this solved soon so I can give you all a little Christmas Present on the TAPR site. Just a little something I've been whipping up. Tnx & 73 (And, for all the traffic handlers, ARL Sixty One!)

656. Mapmaking question

From: N2ZRC@gnn.com (Arte Booten)
Date: Fri, 20 Dec 1996 15:18:25
To: aprssig@tapr.org
Message-ID: <199612202018.PAA23421@mail-e2b.gnn.com>
Rendered body type: text/plain

Hi Mapmakers,

I'm trying to make a series of maps with Mk100k3 (a series of nine 4-mile maps and thirty-six 1-mile maps, four to each 4-mile map.) So far I've gotten all of the 4-mile maps done and all but one of the 1-mile maps. When trying to make this one from within a "DOS" window in Windows 95 the files draw the map and starts to chain the segments. The program then gets shut down and I get a message saying "This program has performed an illegal operation and will be shut down." Very shortly thereafter Norton Utilities tells me that "Virtual Memory Usage is Too High."

I then tried running the program from within a DOS session (shut down the computer, press F8 to select boot to command prompt only" and soon after the segments begin to chain (it gets to 16) the program freezes.

I thought perhaps there was something wrong with the DLG files, so I deleted and unzipped them afresh. Then I tried the above steps again with the same results.

This map is a detailed (default 1-mile detail level, not "+" or "!") street level map with dense urban streets and many of the others are coming out of Task-Skrunch

1.2 with much more than 3000 points (I know how to reduce these further) and am sure
that this map is also too big as is.

This series has been tough to do because of the density of streets and the sheer size of the DLG files. They are from TWO adjacent sets of DLG files (all from the 100K opt. format for my region) and I had to make the streets and hydro maps separately, then combine them with Mapfix. If I tried it otherwise, Mk100k3 wouldn't "see" the hydro DLG files. It's also my first attempt at mapmaking and it's a doozy anyhow.

I don't want to disclose the location of these maps publicly on the SIG just yet (I want it to be a surprise!), but will give specifics (map center and scale) to someone wishing to try to reproduce this problem.

The computer is a PC-clone DX2/50 with 12mB RAM running Win95. I've never seen this "Virtual Memory" stuff before with any of my other mapmaking efforts or, for that matter, with ANY other program.

Thanks for your help. Jack, I hope you see this and can figure it out! 73

APRSdos REPLY/COMMENT: This is fine for me too, since APRSdos stores the WXposit and POSIT in the same place, then if the Win/Mac station sends a posit without the WX included, then this overwrites the WX posit and it is gone for good. DONE... (I also nailed it at 30 minutes too)

Rendered body type: text/plain

```
Well, so far no one has responded to my QRP APRS station on 10.151 LSB
but its probably because of the 100 Hz per hour wandering of the VFO.
Xtal is on order for instln probably after XMAS, so I am going back to 100
watt rig.

ALso, the RAMSEY 20 Watt QRP amp works fine... up to about 7 watts out
with 1 watt in..  Analyze the circuit, and it couldnt possibly go higher.
The transistors are fully driven at that point.  So its OK, just
some optimistic advertising.....  It does give you 7 dB gain to their 1
watt QRP xmtr....  But does nothing for my 5 watt MFJ.

To the HF APRS's,

    I am trying to understand the benefits of having a personal HF APRS
system.  For example, if I have a local GATE, why would I want to have a
personal HF APRS system.  Seems I already have the information the HF
APRS's have thanks to a local GATE.  Isn't the GATE providing me with the
information that the HF APRS see?

    In other words, when I look at my 144.79 APRS map and see APRS's over
the US, aren't I seeing what the HF APRS people are seeing and I don't need
an HF rig.

   Am I missing something?

You only see the info that is specifically passed thru the GATE. For
example, on HF some stations do not put GATE into their paths, so you'd
never see them on the VHF side of the GATE. Also, suppose an HF station
sets his path to APRS via W7LUS,GATE,WIDE. If the GATE in your area is
hearing him direct, and not hearing the digi W7LUS, the posit report
would nat make it onto VHF. In practice I'd say (guess) that only 2/3 of
the HF STATIONS I see make it through the GATE.

You'd probably have better luck on 145.79, HI. But yes, the ability to
see the positions without an HF rig is one of the main reasons for HF
GATES. You will see more stations with your own HF station.

Tommy,

DFsr here, it sounds like the GPS port is off, or your not sending RMC from the Meridian. You can send all the NMEA strings to the DFjr and it will parse the RMC sentence.

After doing a MENU-10 factory reset (GPS port is off from factory)

GOTO MENU-3 (LED between 45 & 90)
GOTO SUB-1 (LED between 0 & 315)
THEN ENTER

This will turn on the GPS port on, default $GPRMC. Watch your data coming in through any terminal program before attempting APRS. I answer tech question over the weekend if you need me.

There is a program called HGCIBM and it is installed 'hgcibm /e' where the /e is for 'emulate' I guess. It allows the Herculese Graphics adapter to behave as if it were a CGA, Color Graphics Adapter. It should work nicely with APRS. 73,

I don't think that battery voltage is the problem. The GPS45 is powered from the automobile electrical system, and the car started up just fine. When the GPS45 is powered externally the bar graph does not show up. I should alsomention that I am using a motorola puck antenna on the dash and has worked just fine in warmer temps. Changing to the standard GPS45 antenna makes no difference.

Tommy,

I forgot to mention that the GPS posit rate is set to a default of 40
seconds,
You may want to shoten this just for your testing.

Posting here on the SIG so others may benefit as well.

I do not own a 45 and I do not have a manual here but if it does not say
"operating" temperature then it means storage temperature.

I didn't post the original question..(GPS shutdown in cold weather)...
but I thought I'd mention that not all Garmin 45s are the same. Mine does
*not* show the battery bar graph when running on external power.

I have a 45XL and it worked fine at 7 degrees at 9000 ft in Utah  deer
hunting Oct 20.   It worked better than my Icom ICZ1A.  It had a hard time.
Once I put it in my jacket for a couple of minutes it worked great also.
You may want to check your batteries.  The cold can trash batteries in a
heartbeat...I have seen on this net that people with the old 45 would keep
getting reset even on external power if the internal batteries were no good.
THe 45XL will run on external power without having batteries in.  However,
so that you don't loose what you got, it is a good idea to have the
batteries inside incase your external power dies.

Just a thought.

Have you tried turning the display illumiation on when you first turn it
on??? I have noticed that the GPS-45 gets warm when I have been underway at
night. Maybe you check and see if that little bit of heat will settle the
thing down.

Yes in fact Claude and yourself are right, i noticed this after going deeper
into the webpage at their site. This would apply to my Courier dual standard
then also. That's a great deal and I already applied for it, won't be available
till the first quarter of 97 though. Thanks to you and Claude i won't miss out
on this one. By the way did my messages get screwed up, i send them from my new
laptop and when i seen them they didn't look right altough i was using the same
mailer.

I have discovered that it will work fine in a window as long as you have the box under properties "always suspend" unchecked. You can switch between a window and a full screen with the alt-enter keystroke. I push F-10 for windoz and then alt-enter. Win 95 has since *learned* to switch to a window by just pushing F-10, and bounce back to full screen with the space bar. Everything seems to work normally, if you are not running any processor demanding programs. a utility I have says it takes about 85% processor time when nothing else is running, and about 15% in the background. When I try to minimize it pauses and nothing is processed (I get hours missing in my H-list and everything is grayed out) I have discovered a egotistical program that checks the box "always suspend" for APRS and causes the same effect. The whole system seems a bit slower, but you'll do fine if you don't run multimedia, etc. So the only options I discovered that works is in a window or full screen.

684. Mery Xmas from the Sproul Bros

From: Keith Sproul <ksproul@hardees.rutgers.edu>
Date: Sat, 21 Dec 96 9:51:04 EST
To: aprssig@tapr.org
Message-ID: <CMM-RU.1.5.851179864.ksproul@hardees.rutgers.edu>
Rendered body type: text/plain

Mery Christmas from the Sproul Brothers...

A Ham's Night Before Christmas

Twas the night before Christmas,
And all through two-meters,
Not a signal was keying up
Any repeaters.

The antennas reached up
From the tower, quite high,
To catch the weak signals
That bounced from the sky.

The children, Tech-Pluses,

Took their HT's to bed,
And dreamed of the day
They'd be Extras, instead.

Mom put on her headphones,
I plugged in the key,
And we tuned 40 meters
For that rare ZK3.

When the meter was pegged
by a signal with power.
It smoked a small diode,
and, I swear, shook the tower.

Mom yanked off her phones,
And with all she could muster
Logged a spot of the signal
On the DX PacketCluster,

While I ran to the window
And peered up at the sky,
To see what could generate
RF that high.

It was way in the distance,
But the moon made it gleam -
A flying sleigh, with an
Eight element beam,

And a little old driver
who looked slightly mean.
So I though for a moment,
That it might be Wayne Green.

But no, it was Santa
The Santa of Hams.
On a mission, this Christmas
To clean up the bands.

He circled the tower,
Then stopped in his track,
And he slid down the coax
Right into the shack.

While Mom and I hid
Behind stacks of CQ,
This Santa of hamming
Knew just what to do.

He cleared off the shack desk
Of paper and parts,
And filled out all my late QSLs
For a start.

He ran copper braid,
Took a steel rod and pounded
It into the earth, till
The station was grounded.

He tightened loose fittings,
Resoldered connections,
Cranked down modulation,
Installed lightning protection.

He neutralized tubes
In my linear amp...
(Never worked right before --
Now it works like a champ).

A new, low-pass filter
Cleaned up the TV,
He corrected the settings
In my TNC.

He repaired the computer
That would not compute,
And he backed up the hard drive
And got it to boot.

Then, he reached really deep
In the bag that he brought,
And he pulled out a big box,
"A new rig?" I thought!

"A new Kenwood? An Icom?
A Yaesu, for me?!"
(If he thought I'd been bad
it might be QRP!)

Yes! The Ultimate Station!
How could I deserve this?
Could it be all those hours
that I worked Public Service?

He hooked it all up
And in record time, quickly
Worked 100 countries,
All down on 160.

I should have been happy,
It was my call he sent,
But the cards and the postage
Will cost two month's rent!

He made final adjustments,
And left a card by the key:
"To Gary, from Santa Claus.
Seventy-Three."

Then he grabbed his HT,
Looked me straight in the eye,
Punched a code on the pad,
And was gone - no good bye.

I ran back to the station,
And the pile-up was big,
But a card from St. Nick
Would be worth my new rig.

Oh, too late, for his final
came over the air.
It was copied all over.
It was heard everywhere.

The Ham's Santa exclaimed
What a ham might expect,
"Merry Christmas to all,
And to all, good DX."

> setup.>

APRSdos REPLY/COMMENT: Good question.  Here are some thoughts.

1) But you being on VHF and not able to see/hear/evaluate the HF
congestion on 10 MHz, you are strongly discouraged from sending any
routine packets back through the gate.  In otherwords, on VHF, you should
consider yourself an HF receiver only..

2) Yoou are only seeing packets sent via GATE,WIDE on HF.  Experienced HF
operators often leave off the added 14 characters for the GATE,WIDE
because they know that it drasticly shortens their packets and therefore
improves the probablilty of a good packet.  HF is most successful for
packets shorter than about 40 bytes.

Now you have, Eric. With all due respect, I prefer real-time updates.
However, 10 to 15 minute ones are a bit more reasonable...

Happy Holidays 2 all and thanks for the Xmas story, Keith Sproul!

The Magellan XL and Meridian XL both have a "simulator" mode that allows one
to test if your system is working properly.  So you can once again buy
Magellan products.

696. W3ADO QRP Heard

From: bbliss@juno.com (William B. Bliss)
Date: Sun, 22 Dec 1996 11:01:08 EST

To: aprssig@tapr.org
Cc: wb4apr@amsat.org
Message-ID: <19961222.080027.2287.0.bbliss@juno.com>
Rendered body type: text/plain

Hi all SIGers,

This Sunday morning @ 221537GMT copied W3ADO
on the APRS BCN text line , out here in CA.
.
"BCN: W3ADO TESTING 4W MFJ QRP RIG"

Did not print his call/symbol on the map at his
location, but was heard and text line seen.

So qrp rigs work if conditions, propgation just
right. Maybee if he digie's thru couple stronger
station, like W7LUS, more could hear/copy him.
Also printed out on my beacon log page, but not on
the Position Log page..
Good work Bob !!! Break the rules and put couple
HF digi stations in your unproto path.. Hi..
Give us a complete run down on your QRP rig.

MERRY XMAS & HAPPY NEW YEAR . TO ALL

73'S & Enjoy, Bill/WB6LPG

NNNN
.

Rendered body type: text/plain

I'm new to APRS - still trying to figure out how to get the signals I
hear on my 2m rig and see on my PK232-MBX with the AEA software in
use to become icons on the WinAPRS map of NJ or for that matter any
map, but as soon as I do I plan on putting in 2 mobile (mine &
wife's) as well as two weather/fixed stations that can be used as
"digipeaters" if there is such a thing on APRS - I plan on putting
the fixed stations in Hewitt NJ (Near Waywayanda State Park/Greenwood
Lake) in Passaic County on the Warwick NY border and the other at the
Military Ocean Terminal in Bayonne NJ on one of my radio towers (In
shadows of NYC and Newark on NY Harbor).

Hopefully this will help the "network" in Northern NJ.

If ANYONE can help me getting these things setup - or just get me
started - I need and appreciate the help.

I can be reached at jpcirone@warwick.net or at
cironej@bayonne-emh3.army.mil

```
I know that this is way off topic but I need an answer FAST before I leave
for the holidays. I am building up a old 486 for my Dad and wanted to give
```

it to him as a gift before I leave tomorrow. I am getting 3 relatively long slow beeps equally spaced from each other as an error code when I boot up. I get no video at all to tell me what is wrong. I have removed every card one by one and still get the error code when I turn it on. Anyone have an idea as to what this code is ?

The reason I am rushing is that I was thinking to give him a taste of Internet for the holidays. I can set up the account right now with defaults and deal with the subscription issue over the phone once I leave. Not only that but he can be back on APRS while I am gone and possibly track me if I can find a GATE in range of NNJ.

Rendered body type: text/plain

Gee, the original posting did not upset me at all. Even the thought of eleven more to follow didn't upset me. All the "RE:" are starting to get on my nerves but then I have seen it so often on this SIG that I guess it is ok to do it.

New Rule of SIG etiquette:

If a message is off topic then everybody in the world should reply to the off topic message on the SIG instead of by private e-mail. Lets be sure we maximize the e-mail everybody gets.

The reason why I am posting an answer to this question on the group is to make a point that you should include as much information as possible so that we can help you with your problem. You did not specify what manufacturer of your BIOS is.

Three beeps signifies:

AMI BIOS: RAM failure particularly due to the high RAM area on pin 20 of the microprocessor

IBM BIOS: 3270 keyboard card error

Unfortunately I have no data for any other BIOS manufacturers.

I would try removing the RAM chips one by one to see if you still get the error. I would also re-seat the processor especially if you have one of those ZIF sockets.

What would be an adequate amount of power to transmit APRS on 2M? I am currently building an APRS system with the HPVFC (as soon as I receive it) from Agrelo Engineering. It will put out 800 milliwatts which I am assuming is not enough. Does anyone have any recommendations on amplifiers for the HPVFC?

Try a <delete> during boot-up to see your CMOS settings?

Might see something screwey there?

Hope that's not a dumb suggestion, Richard, sorry if it is...
Happy Holidays &

713. APRS 40m HF discussion

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Sun, 22 Dec 1996 18:45:15 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.GSO.3.95.961222183115.7849B-100000@arctic>
Rendered body type: text/plain

We need to launch a serious 40 meter crusade for an APRS frequency. I believe this band is the best for local one-two day travel for reporting ones position back home during the day. 30 m I think is a little long and better for ofshore boaters and further distance travelers. ALthough there will be differences beyween N.S.E and W due to local QRM from Canada, Mexico, S.America, etc, we are still best off with one freq. ALthough in the lnog run there is certainly nothing wrong with multiple freqs..

Notice how we carved out our own on 10.151 by shrewd thinknig. Can everyone apply their gray cells and come up with some magic on 40m? I do NOT know the band. I am not an HF person... What freqs are currently in use? Does anyone have a scanning rig and want to write a specturm analyuzer program to scan the band for a few nomths and build up some statistics? I will make a stab at this, but it will take me a while...

Since it will take years to get any satellite APRS channel, we may as well caarve out a solid position on HF for all our traveling needs.
And besides its lonely to travel where there aint no digis...

By the way, soneone did hear my QRP signal. See below:

  That sounds like  a video card or memory problem. Check to see all cards
are seated correctly. Same for memory SIMM. If it's memory, you may have a
bad SIMM or be mixing parity and NON-Parity memory.

  That's a quick down and dirty analysis. I hope I'm right.

723. on the steep learning curve...

From: cunninghamt@ccgate.genrad.com
Date: Sun, 22 Dec 96 01:27:35 EST
To: aprssig@tapr.org
Message-ID: <9611228513.AA851317149@ccgate.genrad.com>
Rendered body type: text/plain

Greetings,

I am on the very steep side of the learning curve with APRS. Since I just acquired a Pico-Packet and a Garmin GPS 45XL, I thought I would put them to some other useful functions when I am traveling on the road, which is a frequent event.

I just got all this stuff working together... GPS interfaced to the Pico-packet and the Pico-Packet to the radio. It appears to be working OK. Since I will be on the road in the next days, weeks, months, etc., I need some advice on how to set the TNC parameters.

So far, I set the GPS to the RTCM/NMEA (NMEA 0183 1.5) 4800 baud
setting. This seems to fill the LTEXT and L1TEXT fields on the
Pico-Packet. The NMEA 0183 2.0 did not seem to work so I changed it
to the 1.5.   I noticed that when I had it set to the NMEA/NMEA
setting, the L1TEXT fields were not being updated until I changed the
GPS receiver to RTCM/NMEA to get the DGPS information.

My TNC settings are MYCALL=N8DEU, MYALIAS=RELAY, UNPROTO=APRS VIA
WIDE, and LOCATION E 6. Where do I put a field for information if
I want to identify as a mobile or perhaps, what frequency I am
monitoring

Since I will be operating on VHF, my question is how should the TNC
settings be adjusted to avoid any nasty side effects if I have not
caused any yet. The hardware plugged and played the first time (no
plug and pray here), so it is a matter of getting the TNC parameters
set correctly. Also, if I have an HF rig available on occasion, what
settings would I use on the TNC. Would they be different than VHF ?

Any help is appreciated since I am starting with my feet on the
ground running.... Next step is getting the APRS software and
tinkering on that end...

Thanks,

Tim - N8DEU (n8deu@amsat.org)

Thanks to all for replying so quickly to the beep codes. Yes it is a AMI
BIOS and yes it probably is the memory, I had bought some new stuff (but
saw it get checked out!) when I did the upgrade. I do not even remember if
it was parity or non parity but I will track down the seller once I get
back and wring him out. It is probably that he gave me the incorrect
parity.

I got a ton of replies so it just proves that everyone on the sig is not
all that bad! Not even one flame! that surprised me. Thanks again for the
replies at least it kept me from spinning my wheels in vein at this late
hour.

Happy Holidays to all!

Please keep in mind foreign broadcast stations. They can be rather
strong (500 kw) and annoying especially since they broadcast a carrier
which will confuse TNCs without DSP (and probably some with DSP) or an
automatic notch. Their actual modulation is rather broad-banded and
will cause problems, but a tight (500 Hz.) IF filter can make them
almost transparent. Most of the broadcast in the 40m band is above
7.100 MHz, but peering into my 1992 reference I see stations on
7.095,7.080,7075. These stations are rather weak compared to most and
transmit intermittently (sorry I can't spell), but with close to 10 Khz
bandwith this can cause some problems. Not everyone can afford to get a
500Hz IF filter and DSP. We may just have to live with it and put up
with interference, besides I have no idea what other Ham operations
might be out there..
        Considering the added atmospheric noise and interference has anyone
considered using pactor? I know not everyone has this either, but it

Yes !  A move to establish a 40m freq is well overdue.  I work a fair
amount of packet on 40m and think that 7089 is about as good as it
going to get there.

APRSdos REPLY/COMMENT: I expect the shortwave QRM in the evenings, but the
intent is a daytime near-vertical-incidence HF reporting freqeuency for
mobiles out a few hundred miles...  WIth thees criteria, can we find a
freq that may be totally useless at night, but which is usable during the
day?  Don't think DX frequency or DX antennas.  What you want is near
vertical incidence.   Hummh,  or is N-V-I even better on 80m?  We know
that 80m multipath in the evenings makes 300 baud packet useless...  But
during the day, there should be no multipath... just very weak sigs..

APRSdos REPLY/COMMENT:  I agree, in fact, I think that is where we can
search, a freq that has a broadcaster in the normal 2.7 KHz passband of
an SSB rig to drive everyohne else away, and then we operate with 500 Hz
filters and get through easily.  I dont have a 500 Hz IF rig yet (that can
both XMT and receive through the same XTAL, BUT that is my current
mission, to design and build a single freq XTAL controlled HF data radio
with 500 HZ bandwidth for dedicated APRS use for under $199...

In the winter, especially mid-winter, there is still going to be severe
qrm from DX broadcast. It lasts until after 10:00 a.m. local in the
midwest and starts up again around 2:00 p.m. NVI antennas will help, but
when the  stations are 20 to 30 dB over S-9, you still hear them big time.

I'm not trying to discourage anyone, just commenting on my experience with
40m mid-winter conditions. I still think 40m would be better than 80m,
where the range will be under 150 miles, during the day and signals fairly
weak, not to mention the contribution of less than 6% efficiency of mobile
antennas on that band. 73,

This is normally a TNC settings problem. Most likly you have HEADERLN ON,
it must be set to off.  If you still cant get it to work, go into a
TERMINAL program and save about 1/2 hour worth of data, then send it to me
```

and I will look at it and see what is going on.

This offer is to anyone who can see data coming into WinAPRS but does not see ANY stations on the screen. Of course I would prefer you read the docs first but I will help when ever I can.

Mark

Rendered body type: text/plain

My OLD KAMs used 1600 and 1800 HZ tones for HF (center freq of 1700 hz). I believe some others use 2125 Hz, and others 2110? Since I am designing a XTAL controled HF DATA Xcvr for APRS, I need to be pretty sure of everyone's tones. Some MFRs still use only the original 170 HZ shift used for 60 WPM RTTY and never even changed for the 200 Hz shift for ASCII.. Lets fill in another table:

HF TNC	LOW	CENTER	HIGH	SHIFT	
BELL 202	2025	2125	2225	200	The original standard for 300 baud
KAM (old)	1600	1700	1800	200	
KAM Plus	?	?	?	?	
MFJ 1270/74B	?	1700	?	?	Only the 1700 is ref'ed in manual
MFJ 1270/74c	2125	2210	2295	170	(I think)
MFJ 1278	2125	2210	2295	170	
PK-232	?	?	?	?	
PK-2232	?	?	?	?	
PK-900	?	?	?	?	
DSP-12	2125	2225	2325	200	(Wierd!)

Don't worry, my design will accomodate all of the above, but I need a baseline for optimizing the design...

Think I got in over my head with my first venture with GPS here.

I have the KCP-3 & HSP Kantronics cable and need help with hooking the HSP 3 wires to a DB9 connector that will mate with the Tripmate DB9 connector. Wires in question from the HSP cable are ground, red & white.

Once these are correctly in place, can someone supply me with the necessary cmds that I need to set the unit into operation.

Thanks es Vry 73 de Tru K8JUG

Does this message mean that you would propose a shift of all
HF APRS ops to Pactor? An interesting thought, but how much
better is broadcast (UI) Pactor?

In the presence of interference I would think that unconnected packet /
pactor copy would be strongly related to the (TNC/modem/controller)
used. As an example, my DSP-232 seems to get better copy on Packet
than broadcast Pactor, probably due to some characteristics of the DSP.
My KAM is the opposite (and of course has no DSP).

Make that Bell 103, not 202. Bell 202 is the standard for VHF packet, 1200/2200 Hz.

The PacComm TNC-220 (out of production) used 2025/2195 Hz.
The TNC-320 and PC-320 use 1600 and 1800 Hz.

CHECK YOUR MEMORY CONFIGURATION!
I have seen this when the wrong bank is filled first, or the memory Simm
is incompatible to the board, or one of the simm strips is not
completely seated.
You will not get any video or anything, is the PC is not seeing the RAM
first..
Hope this helps!
De AA0MM Ross.

749. Delormes Tripmate GPS

From: "Jason Baack" <baack@maine.maine.edu>
Date: Mon, 23 Dec 1996 12:49:37 +0000
To: aprssig@tapr.org
Message-ID: <199612231849.NAA15073@monet.umecut.maine.edu>
Rendered body type: text/plain

Greetings all,
I am a newbie to the group and was wondering a basic question.

Can the GPS that is in Delorme's "Tripmate" package (map CD + GPS
receiver) be utlized to work with the APRS software for amateur use?

The cost is right ($150 ish..) I was wondering if it was possible.

Thanks for any help.

Rendered body type: text/plain

The AEA DSP232 has two "modems" in DSP which will allow selection
of either 1600/1800 Hz or 2125/2325 Hz. I find the low tones work better

on both Tx and Rx thru my FT900.

> MFJ 1278       2125   2210  2295  170

  PK-88          2025    ?    2225  200   PER MANUAL PAGE 4-20
> PK-232          ?      ?     ?     ?
> PK-2232         ?      ?     ?     ?
> PK-900          ?      ?     ?     ?
> DSP-12         2125   2225  2325  200   (Wierd!)
>
```

I imagine that the other AEA PK2XX use the same settings ass the PK-88.

I'm new to APRS. :)

I've got it installed and on, and my TNC tuned to 145.790(S)

I haven't heard anyone in 24 hrs+

Am I on the wrong freq here, or am I in the middle of an "aprs wasteland"?

My QTH is in Muncie, around 40:14N, 85:22W.

I'm running 1W into a discone at 20'. This has done well locally on packet, and can be copied easily at 5 miles with an HT.

Thanks

Yes. Changes have been or are being made to all APRS version to support it.
(Per- Bob, Mark & Keith sig messages)

If you self-init the unit you can use it with current versions as it
will output almost standard NMEA data.

I paid $125 plus 5 postage.

You will need the $39 power adapter or make your own power supply,
as the basic unit is only battery powered.

It is a good deal if you need the SA4 software.
SA4 runs a bit slow on my Softwindows Mac.

Greetings all,
 I am a newbie to the group and was wondering a basic question.

 Can the GPS that is in Delorme's "Tripmate"  package ( map CD + GPS
 receiver) be utlized to work with the APRS software for amateur use?

 The cost is right ( $150 ish..) I was wondering if it was possible.

 Thanks for any help.

A follow-up to a message I just forwarded to the sig.
I was just about to edit the 'color.clr' file in SA4 for monochrome when I
noticed a file called 'bw.clr'. They already have the setup for monochrome
displays. No mention of the file in the Docs so I guess I'll just rename it
to 'color.clr' and see what happens!

 You might try a vericle or beam toward Indianapolis or Chicago. I suspect
if your using a radio shack type discone, that may the problem. I'm in
Rockford, and regulaly see some stations in NW Indiana. Try changing
antennas if you have  a different one. Also try to find out if there is
anyone else in the area running APRS. If they are on a tower, you may be
able to link thru it.

Hi Dave,

     We have a number of APRS Stations in the Dayton area with the
closest to you being near
the Brookville area near I70 about 56 airline miles from you.

Rendered body type: text/plain

```
G'day SIG

In my experience on the HF digital modes (HF Packet, ASCII, AMTOR, RTTY,
PACTOR & G-TOR) I have found the following to be the Internationally
excepted standard.

MARK  2125
SPACE 2295
SHIFT 170

MOST TNC's worth their salt, are easily programed to the above config.

I find the 500Hz filter to be to wide at this noisy QTH. 270Hz is more
to my liking, BUT... a 270Hz (CW/Digital) filter (in most cases) will
either have to be installed in the rig's SSB socket, or the station will
have to run FSK, which in my opinion is the only way to go.

 Oh.., UI PACTOR is actually Forward Error Correcting (FEC).

Bill/LFM

APRS Gateway Stn. for the West Coast

Hi Jim, the GPS 50 is fine for APRS NMEA input. It's a generation old
and the newer units fix their postion a bit faster and have bells &
whistles (like real geographical maps). But of course, they cost more...

If you're doing APRS, the 50 is fine unit.

Happy Holiddays &

That was the main purpose of posting here, finding our who is active
near me, and what I might be doing wrong in freq. The TNC and radio
have been together a LONG time, and all I did was dial it over to APRS.

I'm going to try a beam tonight (I hope) and see what that gets into
either Dayton or Indy. Chicago is a BIT of a haul for me, especially
at 1W. I could add power, but that seems the wrong way to solve the
problem.

Thanks.
```

What do you think my odds are at 1W into a 4 el beam? 56 miles makes
it JUST farther than indy, but I'm more interested in what's going on
over this way rather than indy.

Once enough stations get on, this is going to be VERY slick.

This has only a few changes so download only if these items affect you.
I posted only the APRS77f.zip and the upgrade from 77eto77f.zip.  Here
are changes.  If they DO affect you, please try it out...

Ver 77f: Fixed zoom-to-far crashes by increasing minimum zoom by 2
* IMPORTANT FOR HF: Put HF Alias in Config 6th line of CFIG file.  Change
  -1,4800,0 to -1,4800,ECHO if you want to use old CFIG file...
* Modified Mic TELEMETRY format to include 5 analog channels instead of 4
  to be compatible with MIM format.  Only 4 are still used.  See MIC-E.txt
* Manual WX entries will die after 30 minutes.  The WX report remains but
  the station symbol changes to a dot, making it NOT wx.
* Fixed WX fade to gray still showing CALLsign..
* Tried again to fix "APRS did not see a digipeat message....
* MAPFIX29 modified to overlay COMPRESSED maps and now all of my standard
  distros of maps will be in compressed format for double the load speed

772. Adaptive Tracker reporting rate

From: bob <w2g3zfj@unix.asb.com>
Date: Mon, 23 Dec 1996 19:29:21 -0500
To: aprssig@tapr.org
Message-ID: <32BF23E1.7BF4@unix.asb.com>
Rendered body type: text/plain

Hi Folks and Seasons Greetings!

As I have this week off work, I have managed to complete a project I have had on the 'back burner' for a lonnnng time.

My GPS Engine (A Magnavox unit) only outputs GGA and VTG sentences, in order to save bandwidth I programmed a small microcontroller (the DOMINO from Micromint) to synthesize an RMC sentence from the GGA and VTG. This has worked fine for the last 6 months.

Now, the DOMINO was using only 384 bytes out of the 32k availabe so I thought I would 'tap into' the programming power available and use it to change the trackers reporting rate according to how fast I was proceeding. My initial test, which I got working today, was to set the reporting rate to low (once every 15 mins) if the VTG sentence reported a speed less than 10 knots for >1 min. If the speed was >10knots it would immediately revert back to high (once a minute).

This seems to work OK, my 'only' bug to date has been that if it loses lock it reverts to fast reporting rate. I'll fix that tomorrow!

If anyones interested I will post the info, program etc in the APRS section of my home page (http://www.asb.com/usr/w2g3zfj/aprs1.htm). Let me know if you want it.

Now what I'd like to to next is to get the DOMINO to wake up every 15 mins, power on the GPS, get a fix and then broadcast it. Ideally I'd like to let the system run all the time but I find that if I don't run the car every day then the battery dies, especially in the cold!

Dave,

My QTH is Lawrenceburg, In. near Cincinnati, Ohio. We have a fair amount of APRS here on 145.790 but I see none from the rest of Indiana. I am alone! I would think there should be plenty but I am not seeing them. Perhaps none are close enough to digi through the group in the In-Oh-Ky area.

If you get some action up there maybe I can see it here too. Good luck.

Bob,

I just mailed my registration in last Thursday. If I download the 77f version will my registration still be good? I don't want to cause myself any grief. I do get the "APRS did not see a digipeat message.." error, guess it's not me huh?

Otherwise it works great and I am having a good time with it here in Indiana! Merry Christmas.

The latest version of APRSDos (7.7f) is now available through either FTP or
Netscape/Mosaic from KCAPRS.

For FTP: ftp://ftp.kcaprs.org/files

>From Netscape/Etc.: http://www.kcaprs.org/files

Upgrade file is named 77eto77f.zip
Full Release is names APRS77F.zip

Enjoy!!!

I have posted a new set of map files for the State of Kansas! The file is named KSMAPS01.ZIP. In it you will find many street-level maps as well as regional maps already included in other map distributions.

The file is posted on the TAPR FTP site and the KCAWG web site (www.kcaprs.org)...

Merry Christmas, Kansans!!!

>>   + an exclusive, worldwide allocation at 3500 to 3800 kHz

Looks like we stand to LOSE ground here! (200 kHz in fact...)

>>   + a new band at 4945 to 4995 kHz (additional technical
>>   studies would be required)

OK, this will probably carry the same weight with 40 and 80 meters as the 10 MHz allocation did with 15 and 20 meters. Some potential here!!! Not sure I want it if we have to give up 200 kHz on 80 (biggest part of the phone band, but I WON'T be sorry to see 3895 go away!)

>>   + an "aligned worldwide" allocation at 6900 to 7200 kHz

I doubt this one would go "unpunished"! Of course, if the broadcasters were cleared out of the DX portion then I'd say a fair exchange!!!

```
>>************************************************************************
>>     +  expanded worldwide, primary allocations at 10100 to 10350
>>           and 14000 to 14400 kHz
>>************************************************************************

Oh, YES!!!

>>     +  expanded allocations at 18068 to 18318, 24740-24890, and
>>           28000 to 30000 kHz.

These bands are VASTLY under-utilized and this may be an opportunity for all
amateurs to really expand their operations!  I can see an expansion of the
NOvice phone privileges on 10, more FM, too!  Interesting!!!

All in all, with the exception of the loss of 200 kHz of 80 meter phone band
(the home of the raving lunatic fringe and obsolete ???  traffic nets), my
initial reaction is favorable...

```
Happy Xmas Eve All,

I've been running an APRS GATE on 7.085.00 LSB for
the past 18 hours or so...(near Kansas City).

Only other station heard was Richard, N2JR, in N.
Virginia. Hope you saw me, Richard? Saw no one
over night (expected). When I checked the freq.
this morning, there is a nasty S9+10 heterodyne
near by. Notched it down to S3, and will
continue to camp out here all day. Also Spanish
speaking stations (SSB) occasionally.

Come join me! (it's pretty lonely down here).

>Looks like we stand to LOSE ground here! (200 kHz in fact...)

Actually I believe it will give 3500-3800 world wide, while in ITU Region 2
will keep 3500-4000 KHz.  So no loss for us.

What I can see is a phone band on 30 meters (10200 or 10250 to 10350
probably), as well as more room for 10 meter FM repeaters.

A realligned 40 meter band meaning we don't have to operate split to talk to
those outside ITU Region 2.

A new band in the 4.9 meg band is also neat.

I don't want to open up the pro/no code debate but technician plus should
get additional privledges if we see more spectrum.

Also more room for contest free operation as well as more room for digial
operations including maybe a good 40 meter frequency a possibility for APRS
users.  (See I mentioned APRS!!)
```

Also during the better parts of solar cycles, we have room to really spread out on 12, 17 and 30 meters and really learn how they propagate. Lastly, a phone band on 30 meters will be a really neat thing as its propogation is a mix between 20 and 40, with longer paths than 40 in the day, but it doesn't die as early as 20.

73 and Happy Holidays

788. Adaptive Tracker Controller

From: bob <w2g3zfj@unix.asb.com>
Date: Tue, 24 Dec 1996 10:38:59 -0500
To: aprssig@tapr.org
Message-ID: <32BFF913.7BA@unix.asb.com>
Rendered body type: text/plain

Hi Folks and Seasons Greetings

Several inquiries about my previous posting on an adaptive tracker controller that alters the beacon rate according to your speed. So, I have entered the info (such as it is!) onto my aprs home page (http://www.asb.com/usr/w2g3zfj/aprs1.htm).

Let me know if anyone else tries it.The approach could be easily adapted to many other forms of microcontroller. I previously used a 68HC11 for a similar task before we had GPS code in the TNC's but it was quicker to get going in BASIC for this task. I have also used the BASIC STAMPS but found that they have difficulty in keeping up with the data stream from the GPS unit, maybe the later ones are faster?

I believe that units like this and the MIC-E encoder etc have many useful tasks to perform in the APRS world. For example, it would be trivial for this controller to monitor the ignition status and switch to rapid reporting rate with a different symbol if the car was stolen. It can also monitor analogue values so it could remotely send temperature, battery voltage etc. I'll see how much time I have to pursue these ideas over the holiday.

73 to one and all

bob, w2/g3zfj

```

I FTP'd it at work from ftp.tapr.org last night (Monday) then xfer'd it to my home system. Just tested it after reading your message (with the -t option of the Linux version) and it found no errors.

While it may be obvious to most, and I don't know your level of expertise, allow me to remind you that the file needs to be transferred in binary mode.

One way or another it sounds like your .ZIP file is corrupted.
If I can help, lemme know.

Merry Christmas!

790. WinAPRS Version 1.1.8

From: Mark Sproul <sproul@ap.org>
Date: Tue, 24 Dec 1996 10:45:09 -0500
To: aprssig@tapr.org
Message-ID: <v03007801aee5a9b03071@[165.1.27.20]>
Rendered body type: text/plain

To all WinAPRS users

I have just released version 1.1.8 of WinAPRS, there are MANY new features,
most of which are in direct response to user input and requests. Both the
full versions and the update zip files are both on TAPR and Rutgers.

Rutgers site at ftp://aprs.rutgers.edu/pub/hamradio/aprs/WinAPRS/
TAPR site at ftp://ftp.tapr.org/tapr/SIG/aprssig/files/winstuff/WinAPRS/

The documentation has been updated and is at http://aprs.rutgers.edu/
I made an announcment about a week ago that its a new web server, a Mac
runnining Linux. It seems to me to be preforming much better and the logs
show that it has been getting lots of use but I have not heard any feed
back from users yet.

MacAPRS Version 2.6.8 - December 24, 1996
WinAPRS Version 1.1.8

```
       Added weather charts, last 24 hours of your local weather data
                (if you have a weather unit attached).
       Drawing / Erasing lines now working properly.
       Can read dos COMPRESSED maps
       Added DIRECT STATIONS ONLY to display options.
       Callbook data base support - can now generate the indexes
                from WinAPRS directly, see CD-ROM call sign data bases
       Rewrote the GRIDSQUARE display code so it is MUCH MUCH faster.
       Major improvements to RDF operation and display
       Fixed date bug that caused the date to always show up as 12/31/96
       Fixed bug in rain reporting when using Davis Weather unit.
       Added support for the Delomore Tripmate GPS unit
       Added display of National Weather Services station locations.
       MacAPRS -- Rearanged some of the Menus, this was done for two
                reasons, one to simplify the menus and two, to make the menus
                for MacAPRS and WinAPRS more alike, this makes programming
                and documentation easier.
       Finished Civil Air Patrol / Search And Resqueue grid display,
                now includes labels.
       Can now read dosAPRS .HST files.
       UnprotoPath window bug fixed
```

Merry Christmas to all

Mark Sproul

```

Hi Mark

Just downloaded and installed winaPRS v1.1.8. Is there a bug in the dos
maps display? All of the dos maps I bring up have lots of lines
criss-crossing the display. The win maps work fine. Everything else
seems OK so far. I like the wx display.

Grr.. I can set up a permanent station here as soon as I get my feet
wet. I have a PC
I can dedicate, and I'm already running a network, what's one more node
;)

What would I need, besides TNC, decent antenna, PC and APRS to be a
"wide" node?

I got the new one from TAPR a few minutes ago...

Something is wrong with the U-2000 wx . It was working as
it should with 117, all I did was upgrade and now my pressure is being
transmitted as zero, the gust info is corrupted with what appears to be
the pressure. The string being transmitted is not valid. Lemme see if I
can grab it:

history file shows this as the end of the wx string: /P000/G10288064/U2a

The info before it (in the string) looks normal:

  path info then:@241912zlat/lon_019/012/T015/P000/G10288064/U2a

should it read U2a or U2k...will try restarting the program. Have checked
U2000 in the wx setup. 73,

I rebooted, no change. Wind gust is showing in the weather list as -1120,
pressure still zero.

Interestingly enough, the Weather Display of local weather shows 1029.6
mb. Weather/RDF settings shows 10295.

The weather list itself has severe errors and the string being transmitted
(both viewed as transmitted and reviewed in the history file) has the
errors I noted in the prior message.

I have verified that I have things set for the U-2000 and nothing was
changed from version 117 to the 118 update. Maybe I missed some change I
was supposed to make in the docs...or is this a buglet?

Just loaded up WinAPRS 1.1.8 and noticed something weird!  In both Weather
List window and surrounding my station icon it shows all wx info correctly
EXCEPT WIND GUST.  New display shows winds (0) / wind gust.  That shows as
-1120 MPH.  This a light breeze, but it doesn't seem that windy! ha ha (or ho
ho)

In Weather Display  High and Low wind seems normal.

Anyone else having same/similar problem.

Merry Christmas to all!

Yes, I have had the problem.  The work around is DON'T put the .MAP on the end of the
filename.  The bad problem is that you can't load .DAT files only .MAP files.  So don't delte
your copy of mapfix28.exe yet.

Message-ID: <199612250326.WAA53562@osceola.gate.net>
Rendered body type: text/plain

```
I just purchased the Garmin 45XL with the data cable and did the old
resistor "pull down" trick on the gps to computer line and the NEMA data is
going to the computer just fine.  I then took a resistor and a diode in
series with a zener to ground to change the -12 to +12 to 0 or +5 for the
computer to the gps.  This works great on loop back test ect.  Delorme
Street Atlas 4.0 and Map Expert both read/write waypoints to the GPS and I
can't seem to get these features working.  The tracking functions work
great.  Are the other control lines of the RS232 being used?  Anybody with
any input I would appreciate it.  Please e-mail below.
```

Thanks,

Bob

Hi All,

On Tue, 24 Dec 1996 Jim Duncan replied to my:

>>*************************************************************************
>>     +  expanded worldwide, primary allocations at 10100 to 10350
>>           and 14000 to 14400 kHz
>>*************************************************************************

     with

>Oh, YES!!!

     I think those that've responded so far have missed the point I no-
ticed.  We've been fortunate in that "our" 30M frequency is right there
at the very EDGE of this admittedly underutilized  band (and it's selec-
tion was obviously, at the time, well thought out) but if it's extended
up another 200 kHz, we'll be far more susceptible to QRM as folks will
figure "hey, let's go park ourselves on this nice even number of 10.150
and play PACTOR" or some such.

     We may have to move APRS 30M ops up to 10.351 LSB in order to pre-
serve what we've got.  Which, of course, is a better idea than going DOWN
to 10.099 USB (you can always cut OFF a few inches from the old dipole,
adding it on is a bit more of a problem.)

     As for the proposed Amateur ops at 4.9 mHz, I dunno.  That rubs me
the wrong way, too close to the Time Beacons on 5 MHz ... BIG signals lots
of people (including Hams) rely on.  And kind of like operating too near
the 20M beacon frequencies.  The whole idea appeals to me about the same
as the sound of fingernails on a blackboard.

     All this, of course, is just the take from a lowly no-code that's been
an SWL for about the past twenty or so years.  73 & a Very Merry to All.

There were a couple minor problems with the version we released today.

The first problem was a minor issue with the display of DOS maps.
We added support for the DOS Compressed Map format, and this led
to a bug in the NORMAL DOS maps.

The other bug was in the weather stuff.  We had added a couple
features in the DAVIS weather stuff and this caused the U-2000
to have a problem.

All of this should be fixed now.

We would like thank Hasan Schiers (N0AN) and Bob (w2/g3zfj) for their help
in finding and solving these problems.  We would especially like to thank
Hasan for helping with this late on Christmas Eve...

Steve, your best bet is to contact Product Support for their help. I do
not know the answers, but will try to find out...I hope there is a
toll-free phone # to call from over there. The State-side one is
800-800-1020. BTW, I'm sure there is some software available to
replay your tracks. Ask Product Support about that too.

Happy Holidays,

I agree, if a move is contemplated (and admittedly this is way down the
line), we should move UP to the band edge just like we are now. It will
save lots of qrm, AND in my special case, improve the performance of my
Log Periodic. I will have to go into my TS-870s and figure out how to open
up "out of band transmit". Even now, I can't tranmit on 10.151 lsb. Rig
refuses to go into tx because it detects out of band. Hence, I am on
10.147 usb. 73,

831. Dos APRS manual

From: "Jacques C. VOISIN" <jvoisin@nebula.ispace.com>
Date: Wed, 25 Dec 1996 09:25:59 -0500
To: <aprssig@tapr.org>
Message-ID: <199612251433.JAA22034@nebula.ispace.com>
Rendered body type: text/plain

Greetings to all!
I finally finished the APRS Dos Manual and it includes ver 77e. The manual
includes all readme files of Bob's distribution plus some trips and tricks.
The manual has a table of content and an Index to help find answers for
problems or question. The cost is $15.00 plus shipping $7.00 or if you come
to Orlando Hamcation it will be there. Unfortunately it is too heavy to
send USPS express mail as I took a sample to get the shipping price. If you
want the manual send $15.00 plus shipping cost, check or money order to:
Jacques Voisin, KD4TWB
1245 Minnesota Street
Orlando, FL 32803
I want you to know that I am not making any big money out of this just
covering my expenses.
If you have any questions please address E-Mail direct to me so that we do
not put too much bandwidth on the SIG.
73's
Jacques, KD4TWB

Good morning and Merry Xmas. I writing on behalf of my friend, David
Moye (Palmdale CA). He placed an order from you about two weeks ago and
would like to know the status of the shipment.

He ordered a map, validation and most current version.

Also, if I want to use his latest version, do I just send you $14 for
the validation?

Thanks for your time.

Season's Greetings SIG-Heads,

Plan to stay on 7.085.00 LSB for a few days now...

Have seen this Christmas day:

N2JR, Richard, Warrenton, VA
VA3MW, WX, Canada (all I know)
VE3DOH, WX, ditto
NU5Q, Carl, Slidell, LA
WA4HEI, Pete, UP, MI

All had S9 to S9+15 signals. Please come join us and
set ur UNproto to GATE,WIDE so the locals can CU2.

Happy work tomorrow for some of us!

841. Compass input

From: Dave VanHorn <dvanhorn@cedar.net>
Date: Wed, 25 Dec 1996 21:08:31 -0600
To: aprssig@tapr.org
Message-ID: <32C1EC2F.359B@cedar.net>
Rendered body type: text/plain

How does APRS take a doppler heading input (relative to vehicle) and
translate it to a bearing (relative to earth).

I see how you can take a track where the vehicle is moving and establish
the vehicle's orientation, assuming you aren't driving backwards or
crabbing a heli, but at low speeds, the GPS 50' error is going to be
a big problem. Two sequential position reports can be off by 100' at
max, and in an unspecified direction. The average error between two
positions is probably more like 25', so unless I'm moving more than
25fps, the error induced "noise" is a larger portion of my true vector
than my motion is. This would be a problem.

Is there any way to input compass data (IE Precision Navagation) into
the system?

Thanks

>Is there any way to input compass data (IE Precision Navagation) into
>the system?

I do not have an answer to this question but would be very interested in
one. The Vector 2X application notes state that one of the uses of the
compass is a GPS system backup for azimuth data. I was hoping to incoporate
it into my system as a backup whenever satellites are not available for the
GPS. For people looking for more information point your browser to:
http://www.pcweb.com/pni/.

GPS doesn't use successive positions to obtain course and speed, rather
it uses the doppler shifts of the received signals, which with a
multi-channel receiver is quite accurate. When travelling a straight road
I rarely see more than 0.5 degree swings of the heading. The bigger
problem is when stopped, some gps's will hold the last compass reading
with a significant velocity, but most continue to report headings which
swing wildly and have no relation to actual vehicle heading. Since many
electronic compasses put out NMEA strings, in theory APRS ought to be
able to read this data, but I don't know whether this feature is
implemented in Mac/Win/APRS/dos. Bob? Keith? Mark?

I just hit their web page and found a relatively new product they
manufacture called the TCM2. This compass will output heading information
in NMEA 0183 format. Sounds all that you would need is a microcontroller
controlling the flow of data between the GPS and the compass.

I think you assume too much. Bearing reports via GPS are as accurate as
any other system as SA only affects position reports and not speed or
bearing, assuming you are moving more than about 2 mph. GPS is certainly
as accurate as any "hall effect" sensor compass available. Of course, GPS
bearing information isn't displayed unless you're moving. In that case
some form of direction reporting might be disirable.

I have just recently acquired my xmiter(mfj unit) and am using a pk-12.
I did get some kind of data out of the 45xl to the screen with the aprs
adapter and a laptop running aprsdos as hsp (though nothing to xmiter).
I was using my reg #s for aprs and gps. There is nothing happening when
used as a stand alone system. I am not familiar with the resistor pull
down trick mentioned above. The TNC is setup with the instructions from
the AEA manual(gps + to pin 2 of db25 and gps - to pin 1). If anyone
can help please I would greatly appreciate it.
Thanks in advance.
Merry Christmas!!

Rendered body type: text/plain

The GPS II receiver had a minor software bug that resulted in incorrect
indication of cross track error on the highway screen. The bug was
present in version 2.0.4 an earlier. New shipments (v 2.0.5) have the
problem corrected. Owners with earlier vesrion can return the unit for
upgrade (or replacement). The GPS II is not "sealed" like the GPS 45.

>

There are always several flavors of "commerial modem cable".
I had no problem using a PK-96 TNC but the same cable did not work on a
KPC-3 TNC from my PowerBook another one did.
I use a PCMCIA serial card now.

NOTE:
Anyone doing work with a Computer and RS-232 needs to go to Radio-Shack
and get a RS-232 jumper test box. This will save tons of time testing
the computer link to the TNC, GPS, DFjr, WX.

I would give up my SWR meter before I would give up
my RS-232 tester box.

>... if a move is contemplated (and admittedly this is way down the line),
>we should move UP to the band edge just like we are now.

I don't remember if this proposed expansion is slated for WRC-97 or WRC-99, but think we will have to move within a very short time of its implementation.

>... I will have to go into my TS-870s and figure out how to open up "out
>of band transmit".

No doubt many of the newest batch of the current crop of HF rigs will be able to transmit in what is now "out-of-band" areas with software patches, adding or removing diodes or some such method. Since many of these new boxes are so heavily reliant on "smart sand," the manufacturers aren't (at least we should hope) so short-sighted as to deny the possibility of future band expansion (or, for that matter, contraction) of "legal" amateur bands.

Mods already exist for allowing most, if not all, of these rigs to operate on MARS and CAP frequencies. I'm sure the engineers at Kenwood, Yaesu, Icom, etc. have considered other possibilities that, when cornered at a hamfest and queried about, get that twinkle in their collective eyes that I know we've all seen and clam up or change the subject.

I remember when the IC-706 was about to be released I saw it at Icom's booth at the New York State Convention. When I asked the fine gentleman about whether or not it is modifiable to the proposed expansion of 40 meters of 6.9 to 7.2 mHz, he rapidly started to point out the unit's current requirements on 13.8 volts. But he DID have THAT look in his eyes ... the one that said, "yeah, but I'm not allowed to tell you about it!" I knew it! 73

What is fair? Should KD4TWB be required to go out and purchase a scanner so he could include the illustrations that go with the document on Internet? Obviously, that would raise his cost to those who want a printed copy.

A printed manual is very useful when full screen operations on the computer are running. DOS users cannot create windows to simultaneously display the manual you are speaking of, and those who can, would find the print too small to see, displayed on a typical screen. If you want a free manual, use the one provided with the program you are using, or any of the numerous ones already existing on the Internet. If you want one with a printed index, and illustrations, his is an option.

Hi everyone.

I'm creating a quick reference guide of all weather stations that can be use with APRS, price & requirements. The reason I'm doing this is because here in Puerto Rico we are starting a SKYWARN program and we want to recomend to people to get WX stations that are compatible with APRS. I have a preliminary chart at:

http://www.isla.net/skywarn/wx-equip.html

All comments, suggestions and additions are welcome. Thanks You. TTYL.

I think you assume too much.

Could be, I'm new here, maybe I'm just paranoid.

> Bearing reports via GPS are as accurate as
> any other system as SA only affects position reports and not speed or
> bearing, assuming you are moving more than about 2 mph.

How does that happen? If your positions are in error, then your derived headings are in error as well.

> GPS is certainly as accurate as any "hall effect" sensor compass
> available.

Maybe this is nitpicking, but NOBODY would use hall effect for a serious compass, it's way too numb and noisy. The compasses from Radio Shack are flux gates (a toroid which is saturated with the earth's flux either adding or subtracting from the applied field) or the PNI type which is something similar but different, developed by the US Army.

The original models were done by Zemco in Taiwan, with an LCD display and internal flux gate. The radio shack units are a "low cost" version, with the flux gate remoted to the outside due to magnetic coupling between the gage and the flux gate. The original prototype oscillated wildly because the flux gate was placed within an inch of the gage. Seems the engineers doing the "low costing" weren't completely in sync with the technology :)

In any case, there will be some minimum speed where the errors in the GPS position reports make heading information useless. This speed is greater than zero.

> Of course, GPS bearing information isn't displayed unless you're
> moving. In that case some form of direction reporting might be
> disirable.

That's the point. I often take bearings while stationary, and I may have turned sharply just before stopping, with a final motion of several feet per second. I stop wherever I can get a clean bearing or a spot that seems free of multipath. I'm worried that the reported bearing will be in error due to inaccuracies in the calculated heading. Huge obvious errors aren't a problem except for wasted time, but an error of say 10 degrees would really cause steam since it would be believable.

I wasn't even getting into SA, just a +/- 50' uncertainty between any pair of readings, and assuming a more or less gaussian distribution around zero. I understand under SA it's 100' error.

What is concerning me is the effects of this uncertanity while moving at low speeds. In foxhunting, I am often trolling at <20 mph and changing direction rapidly. In order for this to work with APRS, it seems to me that you need to be able to get the vehicle's heading within a couple of seconds of a change. If your GPS updates are 1/second, then I think you need a minimum of three seconds to aquire a new heading. The error still applies to each position report, so what I picture is three overlapping circles, with my reported position at the center of the circles, and my actual position being anywhere within the three circles at the time of the report.

Even after all that, I'm still in the dark as to how you relate the doppler bearing to the vehicle heading.

1: Who figures out the vehicle's heading? APRS, or the GPS unit?

2: What is the accuracy of that heading data, assuming that I may stop, turn, or back up at any moment?

Typically, I get 15 seconds to take a bearing, with maybe half that time actually useful due to RX squelch and picket-fencing. Hunting a jammer might be more like 2-3 seconds.

I see how this can work well if I'm flying down the freeway at 55, which is 80.6 FPS. The positions never overlap, and from one to the next, the error isn't too huge. If I'm at 10 mph, that's 14.6 FPS. The error in position is 50', so I could have a reported velocity from 114.6 FPS (78 MPH forward) to -85 FPS (57 MPH backward) between two positions. That assumes + or - 100% of the specified error applied in the direction of travel. The error will probably be from side to side as well, giving potentially about 80 degrees error in the reported heading between positions. If you use longer term averaging, then you risk not noticing a sharp turn till some time after it occured.

Is the error typically MUCH less than 50' between reports? That would be very comforting!

In any case, I'm assuming that heading data is derived from successive position reports. If I'm sitting still, or moving slowly enough that the error in position reports causes my heading data to have significant errors, then it seems to me that compass input would be the only way to get an accurate heading.

Understand, I haven't come on-line with this mobile yet, I'm just in the "RTFM and see where the potholes might be" mode.

Within a month I should be ready to take this mess mobile and see what I get. I just got the doppler online today, and still haven't dialled it in to exact zero yet. Not much activity on the local repeaters in

```
the last couple of days :)
```

>
> Steve K4HG

This is more or less what I expected. I am suprised by the use of
doppler for speed! That is one impressive feat IMHO, as I'm sure
my speeds are never a significant fraction of the orbital velocity
of a sattelite!

The low speed errors are exactly what is worrying me. I had visions of
getting to this before, using odometer pulses and a flux gate to do
dead reconing. I would take heading information as available between
odo pulses, and if I have multiple readings, average for heading during
a distance interval. In theory, it ought to be accurate, but there's
no indicaation of forward or reverse, and there is no absolute position
data available. My original approach was to tune the RX to NWS or other
known location transmitters, and triangulate my position from those
bearings. Of course this doubles the uncertanity over the position of
the fox. Sort of a "poor man's GPS". With the new numerically controlled
oscillators, this is a REAL easy thing to do, just sub the NCO for the
LO in a simple VHF rig, and write some code for a micro to drive it.
The problem is that all these little bits take time to prototype and
debug!!!
```

Greg,
Thank you for the information.  I have ver 2.0.5.  I am glad that I don't
have to send it back.  There is a dealer here, but I am not sure that they
would take it to send it back.  The Garmin units are the most used here.
 Price and size is probably the reason.  The military has quite a few
units.

Subject:        [APRSSIG:7717] Re: Garmin GPS II

The GPS II receiver had a minor software bug that resulted in incorrect
indication of cross track error on the highway screen.  The bug was
present in version 2.0.4 an earlier. New shipments (v 2.0.5) have the
problem corrected.  Owners with earlier vesrion can return the unit for
upgrade (or replacement).  The GPS II is not "sealed" like the GPS 45.

I'm not a MAC user, but I own two Kantronics TNC's, and as far as I know all Kantronics products use standard pin configurations, ie 1, 2, 3, 7,

```
and 20.  I do know that you must make sure pin 25 is not connected on a
KAM because its +12 V and it will fry your computer.

The problem you are having using MacAPRS may be that the KPC-3 comes out
of the box in NEWUSER mode....using a standard com program change the
mode to TERMINAL with the command INT TERMINAL.  Otherwise, it will not
recognize half the commands it needs to run APRS from any platform.

MacAPRS/WinAPRS currently use the GPS heading (or any other NMEA device that
has heading information in it)

I am getting an Electronic Compass loaned to me and will get the software to
work with that too.

I have also been told about a 'cheap' electronic compass available from
someplace (DigiKey I think)..   When things calm down a little I am going to
see about buying one of these and making it work too.

I have to add something to my manual that ARRL will not provide is periodic
update when a new version of APRS dos will come out, this a lot more
difficult when you allrady have a printed book as this manual comes in a
ring binder and the pages can easily be changed and a new index and table
of content can be supplied at nominal cost
I just did that yesterday to includes the changes with 77f
73 to all

NOT TRUE!!!  The 12 volts is ONLY present IF the user makes a modification
to the unit. They do NOT come from the manufacturer with pin 25 connected!
The pin-25 mods are included in the manual for user reference...

APRSdos REPLY/COMMENT: APRS uses the GPS heading info.  In DF mode, it
will only use heading info when the vehicle is moving above 4 MPH.  The
docs say this so users know that when they stop, they need to keep the
vehilce oreinted in the same direction...

APRSdos and I believe the others will accept the magnetic compas NMEA
heading sentence too...

>
> The low speed errors are exactly what is worrying me....

APRSdos REPLY/COMMENT: By now you have seen my other response, but since your message evoked a lot of responses, I will repeat it here:

APRSdos when you are in DF mode, will only use the vehicle GPS HEADING info while the vehicle is above 4 MPH. So users simply remember when they cruise to a stop is to NOT turn the vehicle below that speed, IE, pull to the side of the road maintaining the same heading as before. If you DO turn your heading, simply note what it was, and MANUALLY use the INPUT-MY-HEADING command to type in your estimate of your new heading.

This 4 MPH threshold assures that while you sit there, that the wandering GPS headings will NOT change your APRS heading...

APRSdos REPLY/COMMENT: My concern for now is the QRM or long term probabilities.... RIght now, it seems prety quiet. I have a commercial rig here I hope to use as soon as I get an antenna up. I may have to ask everyone to tune to me at that time, since the commercial rig only tunes in 1 KHz increments and since I use 1700 Hz tones on the old KAM, you guys may have to tune a little. But it will take me a while,.... so rest easy...

I have a PNI compass I could send you. This is one of their OEM products, same as Jameco sells.. BTW: I'm the guy who talked them into the raw output mode. They were only going to provide "cooked" data, but I convinced them that the raw would be useful in non-standard applications, like sensing the in-flight orientation of a rocket. (North dosen't move). It's a neat little board, about 1 1/4" by 1 1/2" with a TTL SPI interface. It could be talked to by using handshake lines to run the SPI protocol, or off the paralell port. I'd opt for the paralell port, as the serial side is getting a BIT crowded.

Well yes, but Flux Gate compasses work on basically the same principle, and
most FG devices available to the general public (and affordable) are no more
accurate than your GPS for bearing.

>1: Who figures out the vehicle's heading? APRS, or the GPS unit?

I would assume the GPS.

>
>2: What is the accuracy of that heading data, assuming that I may stop,
>turn, or back up at any moment?

Most GPS's lag by at least a few seconds in bearing data, but accuracy above
about two MPH should be better than + or - 5 degrees.

877. Windows 3.1 Operation of WinAPRS

From: ARusnak@aol.com
Date: Thu, 26 Dec 1996 11:18:48 -0500
To: aprssig@tapr.org
Message-ID: <961226111847_576367568@emout10.mail.aol.com>
Rendered body type: text/plain

I tried to use WAPRS118 on Windows 3.1. It did not work, i.e. would not
start. I did "unzip" it without any difficulties. In reading the
documenation, it states that you need to download Win32s to have this program
work on Windows 3.1. I went through some of the TAPR directories, but could
not find Win32s.
Can someone point me to this file and will this really allow me to work on
Windows 3.1?

Thanks
Al

Without anybody directly saying so, I'm getting the impression that the
50'
error is the far end of the curve, and that the typical error is much
less.

> APRSdos when you are in DF mode, will only use the vehicle GPS HEADING

>
> This 4 MPH threshold assures that while you sit there, that the wandering
> GPS headings will NOT change your APRS heading...

Makes sense. Apparently the typical error is less than a couple of feet then?
4 MPH works out to 5.8 FPS, so I'd presume that the typical error is less than
a foot in order to get a somewhat accurate heading at that speed. You understand
why I was worried? +/- 50' errors at 6 FPS would make my heading somewhat less
certain than the exact position and velocity of an electron!

Schrodinger's Foxhunter! He's probably here, but if you look, he might not be!

Tell me about it! I'm still wading through them! I can't complain about
under-documentation..

> most FG devices available to the general public (and affordable) are no more
> accurate than your GPS for bearing.

The hall effect is a measurement of the deflection of moving charges by the
magnetic field, as they cross through a large block of semiconductor.
Current is passed through the semiconductor in the X axis, and pickups on
the Y axis supply electrons or take electrons depending on the strength
of the applied field. The bulk material has to be really pure, and the total
effect is quite small, so it's an error-prone process. Also, you need at
least two sensors to make a compass, and you now have to match two devices..
All in all, hall effect is best suited to detecting fields of many gauss.

In the flux gate, you ramp up the current and watch the exact point where
the core saturates. This is directly affected by the applied external field.
The earth's field gives you a contribution of .5 A/Turn, so with a

material
that saturates easily, this becomes a rather large effect.

The basic accuracy of the flux gate depends on the material in the
toroid
core being uniform, and the pickup winding being laid down uniformly.
Being macro-scale, they are easier to control, and the compass can also
measure it's own non-linearities and calibrate them out.

With the flux gate, the major error is local variations caused by iron.
Bridges and overpasses are especially problematic. Even your car's field
can be calibrated out of the readings, but you do need to re-cal often.

Just a shot in the dark but how about www.microsoft.com
I think the full docs give a complete appress.

I got win32 installed on my Mac by loading the Dos StreetAtlas3 or SA4
install program. There is even a test program to check for complete

install of Win32

The ENTIRE dosAPRS documentation is online at

        http://aprs.rutgers.edu/

The docs are formated with a html TABLE of contents accessing each of the
read me files.  This works quite well, the only thing there is no index.  I
also have it so you can download the ENTIRE HTML docs in ZIP form so you
can install it locally and access it via any Web brouse OFF-LINE.  This
includes all of the dosAPRS docs and the Mac/WinAPRS docs.  The dos docs
are updated to 7.7

From my docs at

        http://aprs.rutgers.edu/

Refer to our Win32S documentation for installation instructions:

       Installing Win32S for Windows 3.1 and 3.11

       The files can be downloaded from
       Win32s for the Microsoft Windows 3.1x Operating System
       http://www.ncsa.uiuc.edu/SDG/Software/WinMosaic/win32s.htm

-----------

                   Installing Win32S for Windows 3.1
```

Instructions for Installing Win32S on Windows 3.1 and 3.11

This documentation was put together by Arthur Martin, N2QAE, and is included with the WinAPRS documentation with his permission. His original notes have been updated and modified slightly.

Just some of my experiences in getting prepared to run MacAPRS compiled for Windows 3.x Source of the WIN32s is the file OLE32s13.EXE. You can try to download it from

Win32s for the Microsoft Windows 3.1x Operating System
http://www.ncsa.uiuc.edu/SDG/Software/WinMosaic/win32s.htm

If you need more help, refer to this more involved description

Installing Win32s
http://www.ncsa.uiuc.edu/SDG/Software/WinMosaic/win32s.htm

Follow these steps to install Win32S.

1. download OLE32S13.EXE from the www site shown above

2. make a DOS directory (I named it WIN32s) off the root "drive_letter:\WIN32S"

3. copy in the OLE32S13.EXE into that directory

4. Make sure you are in WIN32S directory

5. Execute the self-extracting archive (2.5 Meg) "OLE32S13(return)". All the files in the archive will be left in the WIN32S directory. If you have a backup copy of OLE32S13.EXE stashed away then you can delet it from the WIN32S directory to free up some disk space.

6. Make sure that \DOS\SHARE.EXE is loaded in your CONFIG.SYS file. The Setup program checks for it and gets upset if it isn't running.

7. Start up your Windows 3.x

8. Bring up the Program Manager window

9. Select Run....

10. Type "drive_letter:\WIN32S\SETUP(return)" The Windows Setup program should run. Follow the prompts. Windows must reboot at the completion of Setup or you should do it manually.

11. Refer to the Installation section of the main documentation for WinAPRS™ installation and setup.

12. Then create the WinAPRS™ group and it will create the group window. Setup the WinAPRS™ program info. If you wish, use any icon in the list, but it will be replaced with a USA map icon when you close Program window.

13. Start by double clicking on the map icon. Since there isn't any printing support in the current versions while under windows, you may want to PRINT the docs out using MS-DOS beforehand.

14. You can now go back and DELETE the WIN32S directory that you created, you might want to keep the "OLE32S13.EXE" file around in case you need to re-do it someday, but the directory with all the expanded files is now just wasted disk space.

Beyond this description of what worked for me in Windows 3.1, I assume no reposibility for anything
you do. May it be a useful tool if you get stuck.

Worked for me... not guarenteed, but should be a help. GOOD LUCK!

73 de Art - N2QAE

        Yes, it will allow you to use winaprs... Once you get the Win32S
program, you just run SETUP, and it will install it under your
Windows\System Directory, in a W32S subdirectory.
        Once installed, just start up Winaprs, and it will go OK.
(From your last note, find Win32S at Microsoft.com)

Hi Cliff and everyone

Yes, it includes the StreetAtlas USA ver4.0 with it. I just installed it
and it looks great. I took the Tripmate into the car and initialised it
with the ASTRAL <CR><LF> sequence and it attained lock within 2 minutes.
Not bad performance! Impressed so far.

To: aprssig@tapr.org

Message-ID: <32C2EC99.7227@unix.asb.com>
Rendered body type: text/plain

Hi folks

Just uploaded the latest version of my adaptive tracker program with (hopefully) all of the bugs removed, to my website http://www.asb.com/usr/w2g3zfj/aprs1.htm

The previous version worked but I had to include a counter to prevent re-initialising the tnc when the GPS lost lock momentarily. Now works great, I leave it on most of the time, when I'm moving it outputs about 1/min and when I'm stopped it drops to once every 15 mins.

Let me know if you find it useful

Sorry to jump in here Jim, but I'm afraid your wrong about this. The following quote is from the manual that came with my Version 5.0 KAM...
Pin 25 +12V. This is an alternate input pin for supplying power to the

TNC if desired. If the normal +12 VDC input jack is used, this pin will
be HOT. BE CERTAIN THIS PIN IS NOT CONNECTED TO YOUR COMPUTER.

Your statement is true for the KPC-3, the manual for it describes the
jumper required to power it from pin 25, or to get power out of the TNC
for other purposes if the normal 12 VDC input is used.(I supply power to
my Garmin 45 from the KPC-3 this way to eliminate another power wire.)
Please don't flame unless you are certain of the facts. TNC's are all a
little different, and my statement only applies to older KAM's. If the
KAM Plus requires a jumper mod like the KPC-3, that's a different story.

894. Weather Station Compatability

From: "Bill Carreira Jr." <n1nfc@eagnet.com>
Date: Thu, 26 Dec 1996 18:09:59 -500
To: aprssig@tapr.org
Message-ID: <B0000126880@eagnet.com>
Rendered body type: text/plain

I am curious to find out what weather staions are compatible with
APRS? I have been loking into them and am not sure what to get.
If there is information on this subject, just point me in the right
direction and I will go read it.

Thanks

Well, that doesn't answer the question.  It could be highly possible that
Delorme puts in a speed restriction also.  Anyway, it's a valid question.

In the docs to both dosAPRS and WinAPRS, there is info on
the weather stations that are compatible. Both programs
are available from www.tapr.org, if you go down a few levels.

In our area, Peet Brothers is king. We have about 10 of them
around here and everyone is well pleased. The U-2000 is superb. I have two
U-II's and a U-2000 and am happy with all of them.

I have had some problems with peripherals, like temp sensors  going bad
and a bad temp/humidity sensor, but the wind, rain  peripherals have been
great.

Customer support is FANTASTIC. I have worked directly with Bill Peet as
well as Mr. Stuart and they have been very helpful, understanding and
fair, not to mention competent.

The basic unit has never been a problem, whether U-II or
U-2000 and now, of course they have an intermediate model
called the U-500. I don't know anything about it.

The U-2000's nicest feature in my mind is what appears to be a very
accurate barometeric pressure sensor built into the main unit. I find it
tracks within 1 mb of NWS, which is 18 miles  from me.

WinAPRS supports the U-2000 perfectly. In fact, the latest
release has one of the most clever, informative and clean
presentations of weather info I have ever seen. (Version
1.1.9 on tapr). Many people have reported success with dosAPRS and the
U-2000, but sad to day, I'm not one of them. I have tried 3 different
motherboards and all of them cause dosAPRS to generate a com port overflow
message. I am not alone in
this problem. It has something to do with qbasic's ability to do serial
port handling, and perhaps with high speed buffered uarts. Since the
problem has never been fixed, I am speculating at this point. Older,
slower motherboards appear to be LESS  likely to suffer the problems I am
describing with dosAPRS
and the U-2000. Hopefully someone else will see your query and give you
their take on the U-2000 with dosAPRS, and the
specific motherboards/serial ports they are using.

WinAPRS, on the other hand, is written in C and it's serial
port routines appear flawless. I have never had a serial port problem with
WinAPRS. The latest release of WinAPRS is a Xmas present from the Bros.
Sproul...1.1.9 came out yesterday.

Anyone who has the hardware capability and a wx station, owes it to
themselves to at least look at WinAPRS 1.1.9...you will be amazed....and
the drift I get from Mark and Keith is that this is just the beginning as
far as charts et al go.

This seems like a REALLY important point. If there are tnc's out there, by
factory default that will destroy an RS-232 port by simply plugging what
is supposed to be an RS232 compliant device into it...we have a big
problem.

I would appreciate feedback about this...manufacturer's warning aside, it
makes no sense to put out a device allegedly rs232 compliant with a
voltage on it that can damage an rs232 port...or am I the only one that
thinks this is borderline nuts? Or...are all the "facts" really in dispute
and Kantronics is being smeared by our speculation? If so, my apologies up
front.

I, too, have had difficulties with the Peet temp sensors.  Out of 3, 1 read
5-8 deg high.  But also it was rather mistreated.  The faultly sensor was
left out in direct rain, against what Peet recommends.  Also, it spent some
time buried in a snow bank, which resulted in some very strange temp
readings.  The one out at the WIDE (WA9CJN-15) is in a small sheltered
container, away from the afternoon sun (which will always result in a temp
increase if exposed).  So far, it's staying within 1 deg of the other
```

reporting stations. If I get other outside temp sensors, they'll get the
same protection. The two sensors that read accurately were protected.

Otherwise, if the WX.txt in APRSdos/Readme is followed, especially when it
comes to the serial port line connection, the U-II works fine.

Remember, if using the dos version, the WX option (extra $) is required.

BTW, to find out how accurate your temp sensor is, you may wish to try this:

1.   Take a large glass, and fill it all the way to the top with ice.
2.   Put in just enough cold water to fill the spaces between the ice cubes.
3.   Quickly, put the sensor into the ice/water mixture. Almost immediately the temp will start to rise to whatever the ambient room temp is, as the ice melts.
4.   The temp should read 32 deg +/- 1 deg.

You never saw  " Watch Mr. Wizard " did you  ???

Or did you use plastic ice cubes  :-)
```

If you stir a glass of water and ice then the mixture will stay
near 32 deg F until all the ice melts.

Now MR. Wizard would do this with the glass over a Bunsen burner.

917. More Mapmaking Questions

From: N2ZRC@gnn.com (Arte Booten)
Date: Fri, 27 Dec 1996 00:33:06
To: aprssig@tapr.org
Message-ID: <199612270533.AAA15827@mail-e2b.gnn.com>
Rendered body type: text/plain

Hi All,

Does anyone remember whether the recent versions (I'm using 7.7f) can handle maplists containing more than 159 active maps? I thought I remembered seeing someplace that The Bob'ser upped it to 170. If so, great. If not, well, I'm gonna have problems.

Also, does anybody know whether the "Mkmaplst" program has an upper limit to the number of maps in the directory? What is it, if there is?

Finally, just a reminder to all mapmakers using Mk100k3: When using the "S" option to make a special pattern of maps (other than one or four or nine in a square) remember to input the coordinates for the UPPER LEFT HAND CORNER of the maps you want, NOT the map center! I found this out the hard way, after having made 288 maps (16 at a time) and finding them all to be in the wrong place!

BTW, I'm using Mapfix28 to tidy them up. I, too, have found that I can not load anything that isn't already named "*.map," nor can I load it from anywhere but the default "\aprs\maps\" directory (all of mine are in one of the subdirectories I've made in the "DLG" folder.

Boy, I'm getting real tired of manually winnowing down those 3800-point maps down to size. Only forty more to go! A point at a time... 8-{(73

>question regarding the proper cable for interfacing with my AEA PK-12.
>Do I need the Power/Data Cable or the PC interface Cable?
>Does anyone know of a mail order source for Garmin Accessories at a
>reasonable cost?

you need this address
for Accessories and Software
ftp://sundae.triumf.ca/pub/peter/index.html

The Garmin GPS45 FAQ
ftp://sundae.triumf.ca/pub/peter/gps45faq.txt

The PC interface cable doesn't support external power
but you do get a 9-pin computer plug.

See a Marine boat store for standard prices.

I would pay the extra and get the Power/Data cable and build
the computer/TNC interface plug. For auto use wire in a Radio Shack
cigarette lighter plug (with an LED, so you can tell if it fall out)
Always use a fuse as the antenna plug is powered and could short if
using a different antenna.

>Do I need to use the AEA GPS/Packet single port connector or is there a
>generic mode?

See APRS dos text files for a generic.
There are three basic circuits floating around that are somewhat based on
Bob's original. Which ever one you use be prepared for a little tinkering.

I know we've covered this before, but I wasn't paying attention, because it didn't apply to me.

For Christmas I received the Trimble GPS antenna offered by PacComm. I need to find an MCX to BNC adaptor, as I don't want to cut the plug off the cable. In the future, I plan to buy the GPS-20 engine, but for now I'd like to use the antenna with my Magellan Trailblazer XL.

Can someone please post a source for these adaptors again?

>4.   The temp should read 32 deg +/- 1 deg.

I'd do it differently...

The equilibrium temperature of a distilled water/ice mixture is 32 degrees, and if you use a large enough amount of water/ice it will maintain that temp as long as there is ice. The system you describe is not in equilibrium, and the reading could be erratic...

```
I'd recommend getting a large plastic bowl, filling it half with ice and
half with water, and putting it in the fridge for a couple hours to let
it reach equilibrium, then putting the probe into the middle of the
mixture, still in the fridge to avoid convection currents.

Thats correct. According to the Microsoft Home Page Knowledge Base there's a
bug that causes the incorrect version (16 bit) of MSVCRT40.dll to be
installed rather than the 32 bit version for Win95. Thus some Visual C++
Programs install incorrectly in Win95. Article ID: Q154591 for anyone having
the same problem.

I've not had the "overflow" problems with the U-2000 and DOS APRS on an
AMD 486x4 100 /w 16550 uarts although I have had problems with com
ports while running WinAPRS (Winders 3.11).  Quiting/Restarting Winders also
brought them back, though.  Also, I run AutoWx (which was also written in
QuickBasic) continuously with the U-2000 and don't have any problems when it
runs on the 486/100.  I certainly, though, don't doubt Hasan and the age of
QuickBasic could make it's i/o ability suspect.

Following in the tradition of the TNC-2 which had voltages on pins 10 and 11. But it came with plenty of
```

 warnings and was for experimenters.

934. SSID clarification

From: Richard Parry <rparry@qualcomm.com>
Date: Fri, 27 Dec 1996 07:29:06 -0800
To: aprssig@tapr.org
Message-ID: <v03007804aee999bec841@[129.46.159.136]>
Rendered body type: text/plain

I have a mobile APRS with call W9IF-9. I also have a home station and unsure what call to use. I also have a packet station 1200 baud on 145.01 and soon another on 440. Is there a standard for the SSID. I saw a APRS standard but wonder if there is another standard.

In summary, here is what I am leaning towards, does it make sense.

```
   W9IF-0   -- fixed home APRS station
   W9IF-1   -- fixed home packet station on 145.01
```

```
   W9IF-2   -- fixed home packet tcp/ip station on 440
   W9IF-9   -- mobile APRS station

   Seem reasonable?

>I've not had the "overflow" problems with the U-2000 and DOS APRS on an
>AMD 486x4 100 /w 16550 uarts

Les, I wish I had one of those mb....<g>. I tried it on the following, all
with similar results:

486DX33 Intel
AMD-DX2-80
AMD-DX2-80
AMD-DX4-100

The only mb in my possession that I haven't tried is my Intel P133. All of
those mb had 16550 uarts.

Bob told me that it is a hit and miss situation...hardware
dependent, but no one seems to be able to identify the hw
dependency. Just wrotten luck on my part, I guess. 73,

-------response---------

[As I had pointed out on another occasion, for weather spotting use, one
has to park, turn around or back up to get into favorable positions,
sometimes in a big hurry and without concern for preserving a GPS
heading reading.  On the other hand, the GPS does make a good highway check
for calibration of the mag compass, and also provides the local
compass variation.]

I ordered the Jameco unit a few months ago.  I am needing magnetic heading
for similar DF and mobile wind direction uses also.  It does work, and
provides a decent response rate and resolution.  My only surprise
was that it sure went off the deep end if tilted from horizontal.  That
of course I should have expected, it only senses the field in 2 axes.
Anyway, it looks like it would be useable in a vehicle if one parked on
reasonably level ground.  Or mount it on gimbal rings.  It is a
fluxgate, not a hall effect device.  It uses two individual solenoid
coils at right angles, as opposed to a toroid.  (The little instruction
manual didn't clearly state which end of the device was the north-pointing
axis, it turns out to be the "left" side of the board, if no reversing
options are selected against recommended defaults).  It was about $50.
(It also requires a remotely supplied reset/startup pulse).

For those unfamiliar with it, it delivers TTL output of a serial nature,
but NOT anything that a standard serial comm port could input.  It has 2
separate clock leads, one for bitrate and one for a framing pulse,
and is intended to be used with direct inputs to a microprocessor, or
alternatively a shift register driving a BCD display.  I chose to input
it to a shift register (I used a pair of 74HC595) to drive some LED
driver/decoders and also to drive a D/A chip (via an eprom for code
conversion from BCD to Binary) for an analog output.  Plans for this
concoction include a device similar to a TNC with a 16 ch analog input
device for inputting weather and other inputs, and of course the GPS unit
is tucked away in there.  I am also doing betatesting on TAPR's TNC3
(aka TNC95) and some of these accessories could turn up on it too,
I think John is putting an expansion connector on the TNC3, and it
has plenty of serial ports too.  With an accessory board it wouuld
make a dandy APRS mobile TNC.

It would certainly be possible to use a microcomputer chip to
directly drive and interpret this compass, and output an NMEA string
on a regular serial line, I just happened to have the analog system
and no spare serial ports on this other system so it became a bulk
analog input system.

938. WinAPRS background colors

From: Mark Sproul <sproul@ap.org>
Date: Fri, 27 Dec 1996 10:57:17 -0500
To: aprssig@tapr.org
Message-ID: <v03007800aee9a113895f@[165.1.27.20]>
Rendered body type: text/plain

First, if anyone is trying to send me private email, my email server
currently has a full disk and it is probably rejecting any incoming email.
If you get email bounced from me, just try to send it again latter.

The next release of WinAPRS will have BACKGROUND COLORS, you can set the
MAP background to any color you like, you can control the text of callsigns
to be either BLACK or WHITE. Note, this works on MacAPRS as well.

So, those people that said they would use WinAPRS when it had back ground
colors, get ready. I hope to have this out by next week.

Other items that we are working on

Maxum Weather stations, we have this working, If ANYONE has one of
these or is thinking about getting one let us know please.

Mic-E, we are working on getting the Mic-E support and hope to have
it finished real soon. This will be both Mac and Windows.

Mark

Hold up before you go and purchase anything.

The connector on the antenna is an SMB plug. The connector on the Garmin is an MCX.

Don't want you to waste funds on the wrong items.

940. HSP Problems

From: Jim Duncan <ku0g@sprynet.com>
Date: Fri, 27 Dec 1996 08:41:40 -0800
To: aprssig@tapr.org
Message-ID: <199612271641.IAA25534@m1.sprynet.com>
Rendered body type: text/plain

Hey guys.....

I'm trying to hook up an HSP to the laptop here. It toggles fine but I'm having trouble with the serial port locking up! If I recycle the TNC it comes back but this is a real problem when driving down the highway! The HSP is a known to work properly unit. Any suggestions will be appreciated...

Laptop: Compaq Lite 386SX-25
TNC: KPC-3 or AEA Tiny2 (same problem with both BUT the recycling KPC does NOT release the serial port!)

Thanks....

        Check out the Peetbros.com web page. I like Peet Bros, because, they
have Amatuer Technicians,  and are very intune with Anateur Systems, and
APRS. (They have their own APRS station set up)
        Davis is good too, but I do not feel they are in tune with Amateur
needs as well. (Davis Fans, please do not take it to heart now!!!)
De AAØMM Ross.

HINT:
        We recently put in  a U-2000 at EOC here. The Outside Temp/Humidity
Sensor needed to be on North..
        We ended up Wx proofing the Sensor, buy getting two Rubbermaid BOWLS. A
smaller one to fit inside a  larger one. Mounted Sensor in the inside
smaller  bowl. Then drilled lots of holes in the outer, larger, bowl for
air flow. If the rain or snow blows in, it strikes the sides of the
inner bowl, protecting the sensor, and the precip then runs out the
bottom of the Bowls ASSY...
        Snap the lid on, and painted bowls white.  Left lid off of the inside
bowl containing the sensor.. WORKS GOOD, and no worries abt Moisture
getting into sensor.
Take Care De AAØMM Ross.

947. HF Tones

From: bbliss@juno.com (William B. Bliss)
Date: Fri, 27 Dec 1996 13:51:38 EST
To: aprssig@tapr.org
Cc: wb4apr@amsat.org
Message-ID: <19961227.104950.2287.0.bbliss@juno.com>
Rendered body type: text/plain

```
Hi All u SIGers...

   My KAM Plus, tones per ops manual:
```

P 19. MARk n (n=50 - 4000) (1600)
and must be less than space command.

P31. SPace n (n = 50-4000 (1800)
Used for HF "Packet" ops, must be set greater
than the Mark command. "and (if shift command is
set to MODEM) for Non-Packet modes.

P31. SHift 170|425|850|MODEM (170)
This command sets the default shift used in RTTY,ASCII,
AMTOR, NAVTEX and Pactor modes. When MODEM is specified,
the MARK and SPACE commands set the frequencies used
by adjusting the switched capacitance filters in the KAM Plus.
The MARK and SPACE settings are always used for HF PACKET
tones and when operating G-TOR. When operating in a
non-PACKET mode, the <Ctrl-C>S directive may be used to change
shifts. See also mark, space.

No Center frequency is specified. But assume (1700)..

P35. Digital mode operation on HF amateur bands is usually
accomplished using the LOWER SIDEBAND (LSB) mode of your
radio and applying your transmitted signal to the microphone
input. It is also possible to operate the HF modes with FSK if your
radio supports this mode.

Hostmaster II+ Kam operating program>
P27. HF. On all bands , LOWER SIDE BAND (LSB) is the accepted
standard for RTTY, ASCII, AMTOR, G-TOR, Pactor and PACKET.

Note: APRS dos, README.DIR, HF.TXT., refers to HF operating
frequencies and LOWER SIDE BAND (LSB) operations in the 40M,
30M, 20M. bands, and in the discriptive text of this file.

> KC7BXS
> sparkfel@primenet.com

The trimble antenna has an smb connector. If you need a bnc adapter
here is an easy solution. If you can find the crimp on type bnc
connector that has the center pin attatched to the nut then add a panel
mount smb connector from digi-key - cut off the ears of the panel mount
and a little of the crimp sleeve off of the nut, slip the smb connector
into the back of the bnc, solder the pin, then the barrel to the nut and
assemble.
Works beautiful.

The problem I have with a "standard", Richard, is that I run the
regional bbs along with a BPQNode. I also have my call on the NWS
packet station on APRS. Because of all this, I have 3-4 SSID's floating
around at any given moment. And, when I fire up the mobile GPS..there's
another one. One more interesting aspect... Somewhere back in time,
packet users in the West Texas area decided that -9 would be for their
PBBS's. I know this isn't the standard. But, who said west Texan's
where ever standard. I am for a standard to simplify. But, it might
not work in my case.

Rendered body type: text/plain

Hi SIGers,
    Just noticed a slight difference in the data readout
format on my APRSdos weather reports.

    As indicated in examples below, the later versions of
APRS , Ver77 on have dropped the Upper case letters of
data field to lower case in most instances., aparantly after
the Temp/Rain/p,b,h, etc....?????

    Where we had Txx/Rxxx/Pxxx/Bxxx/Hxxx/U2a ,

    Now see : Txx/RxxxpxxxgoooUII   and other variations,

    Is this change intentional, a programing error, or something
overlooked ?????..

    W9IF-0   -- fixed home APRS station
    W9IF-1   -- fixed home packet station on 145.01
    W9IF-2   -- fixed home packet tcp/ip station on 440
    W9IF-9   -- mobile APRS station

    Seem reasonable?
  >>
Howdy

We have a bunch of mobile APRS vehicles as part of our t-Hunt group and
decided we should make the mobiles w/o a SSID.  This keeps the maps a bit
less cluttered as only the call sign shows up as being all over the map..
  We also use -1 for the home stations but after that it dosen't make a lot
of difference.

Good luck

    Looks good to me, Most around here are just using their call, In
mycase, LB9LBU for home APRS station. Then adding other -# for additional
units.

>Sensor needed to be on North..

Confirming my earlier compliment of Peet Bros. customer service:

My new temp/humidity sensor arrived today, at no charge.
The also sent me a free separate temp sensor that was well
out of warranty, because I indicated I had been having trouble with it for
some time.

I have all my wx sensors in a ventillated box on the north side of a pole.
It is fully shaded and weather guarded (not wx
proofed...or they wouldn't work). Now, let's see how well the  new
peripherals work.

I hope to have them up tomorrow..right now the temp/humidity
sensor is sitting on a chair, showing 60 degrees...so those of you copying
my packets, don't get your hopes up...it's really 25 deg and we have 5
inches of snow on the ground.

Again, Kudos to Bill and his staff at Peet Bros, a first class company.

>For some reason, my IP won't pass the
>originators address. so all my incoming messages are from
>aprssig@tapr.org. So without a direct email address, I'm forced to reply
>via the SIG. I'll have to work on the IP stuff.

This is a much more common problem than many appreciate. I had to put up
with it for 9 months, because my ISP was stripping the headers. Galacticom
software is famous for it. Fortunately, about three weeks or so ago, the
ISP upgraded their software and now the problem is gone. I would recommend
looking at the headers of incoming aprssig messages. I wouldn't be
surprised to see that the originator's email address has been stripped. In
that case you need to make a "stern" contact with your service
provider....they are breaking the rules and screwing everyone else up.

In the mean time, as I have asked others to do in the past, PLEASE put
your return private email address in the signature of your messages. That
way, a private reply can be made, even though the ISP is stripping the
header. Example below:

One problem I see with this freq is that it is in the middle of the RTTY
sub-band. About once a month during the RTTY contests you will probably get
trashed by RTTY QRM. I will probably be one of them running a Kw to a 2el beam.

There isn't much software out there that will 'kill' memory. I suspect that your problem is one of two things:

1 - You are getting corrosion on the memory connector pins. Remove the memory and re-insert a couple of times. Be sure not to kill the memory with ESD (Electro Static Discharge - sparks). Keep a finger or arm on the metal part of the case to discharge yourself as you do this.

2 - The system CMOS settings may have changed recently. Go into the 'CMOS SETUP' and make sure that you have enough memory 'wait states' (timing delays) to make your systems memory work. Just to test, set all the timing to the slowest. If it works then find a timing setting that works for your system.

I suspect it is number (2) above. Your machine is a 50 Mhz machine with a clock doubler in the CPU. That means that your machine is running at 50 Mhz, which is pretty quick. You should have 60 ns memory, although 70 or 80 will work with enough wait states. The 60 ns memory will require fewer, and therefore your machine will run a bit faster. 73,

John W. Wilson, KN4HX

Since all simm assemblies rely on pressure for contact, try removing all memory units and re-seating them. Actual contacts may be cleaned with a pencil erasure.

Good Luck!

Hi Dave, thanks for the info. Personally, I could live with a day off,
once a month. Maybe we could shut down APRS that day if we know ahead
when that would be. I really don't care what freq is used, so long as
we can live peacefully with our brother/sister hams!

Dave, can you suggest a freq? After a week of work on 7.085, I find
lots of QRM there from time to time. I would like to propose we try
7.088.00 LSB as a standard freq---it seems a bit less congested. That's
probably still in the RTTY band I bet?...

Anyway, what do the rest of you think?

Thanks again Dave, for some constructive criticism...:)

I recently went thru a similar experience....I cut off the connector on
my Trimble and bought a crimp-on BNC for RG-174. Do *not* bother trying
to crimp this connector (unless you have the *proper* crimp tool) ....
it is easy to *solder* this connector on to the RG-174 cable instead.

This is a new format begun several months ago to allow higher precision,
note one extra digit for each of the lower case values, droping the '/'
between each save the space for the additional precision made possible by
the newer weather stations.

Check out protocol.txt in the help files.

After Checking a RTTY contest calender I found that there are at least 19 RTTY contests for 1997 starting on the Jan. 1st. Most of these are weekends lasting 48 hours. I didn't bother to check the specifics, but most are all band which would give us about 40 days of RTTY QRM. I think that is a bit much especially since they are on the weekends when the mobiles might want to use 40m the most.

Why doesn't someone try in the 7.100-7.150 range which is virtually unused by hams?
Yes, I know it is filled with broadcast stations, but our signals are narrow enough not to disrupt the reception of a strong station. (like VOA) If we use a freq. like 7.100, 7.105, etc. -one that has a strong broadcast station, we will be protected by all further QRM. All you need to do to see what I mean is to tune in to a strong station on AM and push ssb to see how much more reduced it is. Then if you can switch to a narrower mode to receive like RTTY fsk and after tuning correctly to match the sideband the broadcast station almost disappears. You can't even hear one with a 500hz. filter. I must warn anyone who might want to try this to turn the AGC off if possible since the carriers of the broadcast will drastically decrease your sensitivity even if it isn't audible.

I don't have any ideas of a specific frequency so someone else will have to come up with that.

Thank you kind sir, give a few days to reevaluate it after your change, and I feel sure my registration fee will be on the way to you..

By the way, your quick response to this suggestions speaks volumes for you and your support of customer suggestions..

Keep up the good work and thanks

Don

We used to 'erase' the dirty gold contacts years ago but were then
advised that the eraser did more eventual damage than the immediate
cleaning from the rubbing.  Try denatured alcohol on a napkin, 90 percent
if you can find it.  That is also the stuff (90 percent) that is
suggested for cleaning tape heads of all sorts.  73,

N2XDD was asking about adapter boards

I gather you mean a "HSP Adapter" (Hardware Serial Port)

I think Bob told me once that FAR Circuits was doing up a board.
It is a pretty simple circuit to breadboard, though.
I just spent the money for the PacComm one 'cause it wasn't worth my time
to diddle with it.

Of course Now that I use the PicoPacket, it is built in to the Pico's
hardware/software.

When you do get an HSP, do yourself a favor and make sure it is getting
power- either from the laptop or the tnc or a 9v battery. It is very
frustrating to try to get an unpowered circuit working- and that is the
most frequent problem with HSP adapters.

> this problem?

Unfortunately I'm to blame for the problems with MapFix29 as Bob
implemented some suggestions that I sent him but I had not fully tested.
The workaround for the time being is as follows:

MapFix defaults to the \APRS\MAPS\ directory as Arte has pointed out. You
can change this by typing the path name in front of the file name when
you load the map. MapFix will then use the new path as the default until
you type a new path name. Also, a currect bug in the program (I've sent a
fix to Bob) means that you can only load filenames with the .map
extension and only if you leave off the .map. When things get working
properly, to load a map from the \APRS\MAPS\ directory you will only need
to type in the name of the map leaving off the path and the .map
extension.

If you guys who pound out the maps feel that the old way was better or
have any better ideas, I (and Bob) would like to hear them.

Happy New Year to all.

Michael

Yes, very true, I overlooked it.  The Important point is that we MUST
avoid the RTTY sub-band.  If we could tuck ourselves just inside the
```

```
novice sub-band like 7.100 USB then we wouldn't create too much of a
problem.  The novices won't try to work on the band edge.  And the RTTY
will stay away from the power limitations.  It should be ok as long as
no one needs to run over 200w.

Anyone got a tripmate.  It says on the box, that it will only work with the delorme s/w, but I saw a
posting on the newsgroups about someone that had the docs for the gps part and said that it will respond
 to NMEA strings, but you might have to send it a command then then have it respond as opposed to just
waiting for it to respone on it's own.  I might be a real inexpensive GPS if it can work, sells for
less than $150 and included the delorme Street Atlas 4.0 S/W on CD.

Please post to group and email if you would please

Thanks,
Alan Adamson

Hi SIGers,
    My previous msg on weather report format.V7.7f.
Thanks Steve/K4HG for info on where I should look.
  KISS for us older folks who don't see and read all
the new info. WX format fully explained in WX.TXT and
PROTOCOL.TXT files of the DOS Readme.Dir. Still like the
old single stroke commands, all this new fancy commands
confusing. KISS...Now see new Unproto path entry required,
where, just plain U and type in what wanted. was so easy.
Another KISS ..   Sorry for the wasted info/bandwidth.

      HAPPY NEW YEAR , TO all you SIGGERS & sinners.
  73's & Enjoy, Bill/WB6LPG

I just bought the DeLorme Tripmate.  I seem to be having trouble getting
data from it. I connected it directly to my laptop and put it on the
Terminal page of APRS to see what data was coming through. I also tried this
on other Terminal programs on the laptop and palmtop and got the same data.
This is what I received:
$PRWIRID,12,01,05,07/29/96,0003*46
$GPRMC,235959,V,3650.9863,N,0763.1587,W,0.000,0.0,120895,10,3,W*58
$PRWIZCH,00,0,00,0,00,0,00,0,00,0,00,0,00,0,00,0,00,0,00,0,00,0,00,0*4D
ASTRAL
ASTRAL
ASTRAL
ASTRAL
etc.

It keeps doing ASTRAL. If I shut it off and start over it will repeat the
first 3 lines and then just ASTRAL.  The coordinates in the 2nd sentence are
correct for my location, but that line has never changed even when I move.

Anyone have any idea what I am doing wrong?  It had plently of time to
acquire satellites.  I even put in my system in place of my GPS45XL, but it
did not work there.
```

What is ASTRAL?

Any help would be greatly appreciated. 73, Jud, KE4HFX

One posted today
>I just bought the DeLorme Tripmate.>ASTRAL
>ASTRAL

then also today

>Anyone got a tripmate. It says on the box,

There were lots of posting about the Tripmate this month you must have
missed ....   see the tapr mail archives

I posted Monday the Tripmate FAQ address here it is again :
ftp://sundae.triumf.ca/pub/peter/tripmate.faq

read that first.

If you tie pin 2 to 3, making the output go into the input
the Tripmat will self start. Then just run ground and output

to your computer. DOS, WIN, MAC APRS can read the NMEA output.

Lots of GPS/NMEA info on:

ftp://sundae.triumf.ca/pub/peter/index.html

The Garmin GPS45 FAQ is on:

ftp://sundae.triumf.ca/pub/peter/gps45faq.txt

1008. Re: 30 and 40 meter monitor

From: Clifford Buttschardt <cbuttsch@slonet.org>
Date: Sat, 28 Dec 1996 13:55:07 -0800 (PST)
To: aprssig@tapr.org
Message-ID: <Pine.GSO.3.95.961228133558.23781I-100000@oso.slonet.org>
Rendered body type: text/plain

```
There has been a suggestion made to enter the novice portion of 40 meters
with APRS signals.  At first I supported this idea but no longer!  Here is
the reason why.  These stations heard on 10151.5.  How many more on 40 M??
28Dec 00-02 UTC:  K7PW, KA5ULE, WV0T, KJ7HZ, AA5PK, N7UVH
      20-21 UTC:  KF0ZH, N6OAA, VE3NEC, WC7R, WA8RPR, KB7LOJ, W1CDM,
KO6XS, VE4GN, KD6UDC, W7FEN, KH0MP, W9VZK, K5QQ, AC6JA, KI6MP, K6KRW,
WV0T, W1TDG, KB7KOJ, VE3NP, KC0CZ, W7LUS, W7JZU, WB9HBH, KB6LFM, KE3WA,
KE6NEX, W1GTT
```

This of course, is just two one hour samples. The packets go on almost continually during the weekend. Do you think we have a right to enter the novice band with such activity? The very least objectionable solution might be to to place our MARK frequency at 7100 minus 2125 Hertz or 7097.87 KHz. We seem to have sucessfully captured the 30 meter frequency with this idea in mind. Cliff Buttschardt K7RR

1013. javAPRS Test Results

From: Steve Dimse <sdimse@bridge.net>
Date: Sat, 28 Dec 96 19:27:03 -0500
To: <aprssig@tapr.org>
Message-ID: <199612290027.TAA10537@newworld.bridge.net>
Rendered body type: text/plain

```
Thanks to all who helped me test javAPRS. The problem surfaced when I
improved the threading of the program to improve it's responsiveness and
eliminate the annoying multiple redraw when scrolling through the applet
in Netscape. The problem only surfaces in Windows NT and results in
incomplete map drawing. To give you an idea of how poorly cross-platform
Java is, here are the results:

Windows 95....11 of 12 good, one "Applet won't initialize" crash
(different bug)

Mac....3 of 3 good

OS/2   0 of 1, crashes Netscape completely

Windows NT 0 of 2

Results like these make it very hard to work in Java! I may have to go
back to the old way of handling updates.

Steve K4HG

P.S. Just as I was about to send this message I got another report from a

Mac user that showed the same bug as Netscape....arrrg!

Steve

continuously. The MIR operations were moved without any prior notice or
inquiry put forth to anyone.
>
>2) Stations operating with proper FM bandwidth should NOT present a
problem of interference with operations 10 kHz away from their primary
operating frequency.
>
>3) It would seem that you have a problem in your immediate area which
should be addressed to those stations operating APRS in your vicinity rather
than to me, 500 miles away.
>
>From my point of view, while I appreciate your concern and appreciate the
presence of the MIR operations and their availability to the general amateur
populace, the move on MIR's part was made without any consideration to
potential interference to terrestrial operations on adjacent frequencies.
Personally, I would hope that this matter could be resolved be rational
persons working together. We have an average of 20 stations operating APRS
here in the Kansas City area. We also have a goodly number of amateurs
actively working MIR. We are not encountering problems here in our area
with interference either way.
>
>I appreciate your concern and your opinion and wish you the best of luck in
working things out in Indianapolis. If I can be of further service, please
advise me, however I do not believe that I can be of much influence or
assistance outside of my own area.

Hold on, folks!!!!

It was pointed out to me today that Unattended Gateway operations were NOT
legal on 40 meters except between 7100 and 7105 by W0XK. We'd better take a
look at Part 97 before we jump on the bandwagon for a 40 meter frequency
since it appears that we may be operating these gateways in violation of
Part 97. I'll do a little more research, but at this time I would recommend
that 40 meter gateway operations be put on hold....

I have worked MIR many times, as well as most of the shuttle SAREX
flights. I'm also a very active in APRS, I see both sides of the issue.
This has been discussed for quite a while on the AMSAT and APRS mailing
lists.

Your message seems to imply that APRS intentionally interferes with MIR.
This could not be further from the truth. No one owns or controls any
frequency, but the FCC regulations do give priority to QSOs already in
progress, and to coordinated frequency allocations. 145.79 is coordinated
in much of the US for APRS operation. Also, the international satellite
band starts at 145.800. Fully half of the MIR transmissions occur outside
the band allocated to satellite use. The frequency of 145.8 was chosen
unilaterally without consideration for users in the US. It was a most
unfortunate choice.
```

The question is, does the uniqueness of MIR, with 30-40 minutes a day of
activity in any location worth moving literally a thousand or more 24 hr
stations, that have occupied the frequency for many years?

The nationwide APRS network depends on the use of a single frequency
nationwise. Except for a very few areas in the country (SF Bay being the
most prominant on 145.01) this frequency is 145.79. To move APRS means
finding a single frequency that is free in much of the US. Not very
likely...

The leadership of AMSAT NA is working with other interested parties to
try to find a mutually acceptable solution. Until then I suggest we all
try to be patient and understanding.

It looks like we will have a small problem.
Well which came first the chicken or the egg?

145.790 or 145.800

What will we do??

>ter or have any better ideas, I (and Bob) would like to hear them.

     The idea of a "default" path is okay, but I don't think most of us put
"maps-in-progress" in the \APRS\MAPS\ directory.  I use \DLG\ myself.  The
default you've suggested would be fine for altering existing maps (which,
presumably, work OK as-is,) but I think the majority of MAPFIX users are us-
ing it to clean up maps that we're in the process of making.

     As such, the inability to load anything NOT named *.map makes MAPFIX29
practically useless in the production of new maps.  Not all of us are bles-
sed with regions in which one can select a given map center and range and
have Mk100k3 give us a nice, ready-to-go map of 3000 points or less.  In my
current project I've run across forty-or-so maps out of 100+ that are over
the 3500 level, a dozen of which are over 4000 and, as I've described it to
Jack Cavanagh, there is the "Map From Hell" that, even after Task-Scrunching
to 1.5, is STILL over 5100 points!

     We absolutely NEED the ability to load both *.map and *.dat files in
order to produce usable maps.  That's my two-cents, and I'll be forced to
use MAPFIX28 unless these issues are addressed with a new version.  73

APRS users will not endear themselves to anyone nor end up with a viable
solution by trying to shoehorn out a frequency on 40.  Infringing on the
novice CW band is not the answer, nor is plopping in the middle of the
"RTTY QRM" as someone mentioned.  And there isn't what you might call a
great deal of room amongst the established packet BBS stations, most of
which having been in place for years, legality of their operations prior
to the new rules notwithstanding.  Forty is full, just like the two meter
band, and even though people are STILL trying to shove in just ONE more
repeater, it doesn't work there either, and makes many people angry.
Leave forty to the folks who are already there and foreign broadcast.  My
opinion, worth whatever value you assign to it. --

How true!

With all the new folks getting on (and they seem to be showing up in droves!), I wish there was a way that a similar message could be posted every day automatically. Of course that would be a real pain for the rest of us, to have to read (delete) it each time.

What about (if we EVER can find out who CONTROLS the list), after he fixes the "reply to:" field- he adds some simple text about the archives and WHERE TO FIND THE FAQ for all these questions.

The new folks have no way of knowing that the thing has been discussed ad nauseum and no one knows if anyone else has answered their questions so we all try to help.

When people send answers to questions without reading all of the incoming mail first, they end up answering the same thing over and over along with everyone else.

A suggestion: In Eudora, you can QUEUE outgoing mail rather than sending it when you end it. That way you can delete all the replies that are unneeded before you send them. Even then, I still screw up though.

Anyway- I'm just rambling on about some suggestions that might cut down wasted effort and duplicate answers.

That, folks, would be a #1 reason to have a newsgroup- but notice ** I am not suggesting this!!!!*** I'd rather have what we have instead of newsgroup spam!

Thanks for listening. Maybe some of these suggestions are worth something.

>station. Moving its frequency may be possible, or may not. If the rig
>is xtal controlled, a change may not be possible at all, unless new
>xtals can be field installed. The cost of placing a new radio in orbit
>would be very high, in fuel alone.
>
The choice is obvious to you, not to me or the thousand other hams who
use APRS.

The radio is a commercial synthesized rig. Many APRS digis, however, are
converted commercial radios which do use crystals. The cost to move APRS
would be far higher!

>APRS has is of limited use. It can be installed in a car with a gps to

>amateur regulations. I am state communications chairman for a
>non-government agency administering a nationwide system of disaster
>relief fnd APRS, unlike many amateur technology, has no function in a
>disaster.

1. Clearly you are anti-APRS, there is not much point in my trying to
convince you, but

2. What about SKYWARN weather reporting, the Olympic Torch Run, Rose
Parade, Army-Navy football run, Marine Corps Marathon in DC, and many
local events...I have personally participated in a half dozen in two
years where APRS was extremely useful. How much public service has MIR
provided in the last 2 years?

3. Who said public service is the judge of this anyway?

>If there is a possibilty a mobile unit may become lost, we could give

>for a weak signal, it is best if other stations are not on the
>frequency!
>
What's more susceptible to errors, voice reports and manual plotting of
position or digital comm and computer plotting? What's faster? Why bother
with the GPS and radio, just give them a sextant and let them send their
posit with smoke signals!

>Tying up a frequency that causes a problem for the Mir with constant
>beacons of the position of stations in the ?network? makes no sense.
>
Again, to you. I recently took a cross country trip in my van, heavily
outfitted with radio equipment. With the APRS network, my mother in
California, and my YL in Florida were able to see where I was and that I
was OK. Any by the way, a system that can track a mobile from one end of
the country to the other is a network, not a ?network?! Finally, does
this cause a problem to MIR? Or is it just causing a problem to you?

>It is possible to tie DF operation into APRS, but here most of the DF
>ers are not on packet, and, in any event, a doppler DF unit can be tied
>to a GPS and to a notebook computer with maps for the ultimate in fox
>location.
>
Excuse me, but APRS does this already, I use the Aguello DF Jr. with
MacAPRS...plots bearings directly on the screen. Get several of us
together, and we can use APRS to plot each others bearings on screen, and
find an unknown signal a lot quicker. True enough, most DF'er aren't on
APRS...but most DF'ers don't talk to MIR either.

>APRS is a solution looking for a problem. If something occurs such that
>APRS will be usefull, that is the time to start operating. Just tying
>up a frequency to no purpose, as our local APRS digipeater does, is
>nonsence.
>

And what about all those packet BBS's that ping FORSALE messages around?
And all the thousands of repeaters that carry nothing but innane
conversations? Or all the hams trying to connect to a tiny TNC on MIR so
they can get a little piece of paper that says they did it. Face it, very
little in ham radio is relevant. We do it for fun. Along the way, we
accumulate some skills that we occasionally use for the public good, to
repay in a small way the spectrum we are given.

Before you start telling me the stories about how important ham radio is
to MIR, the family phone calls, the school contacts, etc. let me point
out these activities occur on unpublished frequencies other than 145.800.

Our play is important though, because it gives us the incentive to build
our networks, maintain our repeaters, hone our skills, so when we _are_
needed, we are ready.

>If I went to a KW on 2 and blanked the APRS digi by calling the MIR 24
>hours a day, when it is not even in range, all the APRS operators would
>be very mad. Yet they put out beacons of no use, 24 hours a day, and
>interfere with the Mir, when most, if not all, of them are not at their
>rigs and the "data" they transmit will not be seen, or read, by anyone.
>
None of use are using kilowatts. We are on 145.79, where we have been for
many years, with low power digis, doing something we find enjoyable. Our
beacons are of use to us, to the National Weather Service, and at special
events, to others.

How would you feel if you had a traffic net, passing important messages
like "Hi Jack, at the fair there is a ham radio booth and they send
messages for free. Call you soon, love Jill". You'd done this net for
years, it was your major source of enjoyment in ham radio, you had lots
of friends there, and a couple of times you had even passed some
important traffic. Suddenly a rare DX station decides he will listen on a
frequency 10 khz away for a half hour a day. All of a sudden, a bunch of
DXers demand that you move your net somewhere else because their DX is
more important than your "meaningless" traffic, and the strong signals
from your net make it hard to hear the weak DX.

That is a far more realistic analogy than yours...even then it would be
easier to move a traffic net than the APRS net.

Finally, as I said, AMSAT NA is not pleased with the MIR frequency and is
working to change it. I would again recommend tolerance and patience.

>With the barometric pressure at 29.92...:)

I think you guys are overthinking this whole situation.  Let me make an
example, at work (at a electric generation station) we us various
instruments for measuring parameters.  People frequently use a digital
thermometer which is calibrated to, and displays, the tenth of a degree.
When applied to measure bulk temperature of a room it is false accuracy to
report the temperature to the tenth of a degree.  My point is that while it
is good to attempt to have a reasonable degree of accuracy, it is not
reasonable to try to calibrate and report temperature to any high degree of
alleged accuracy, this isn't rocket science anyway.

>>   In order to avoid interference with the U.S. Space Shuttle, the Mir
>>space station has moved to 145.800 MHz. In Indianapolis, I am having
>>problems with stations off frequency from 145.800 and they appear to be
>>on 145.79 .

This has been talked about for weeks on the AMSAT sig.

I don't think the APRS stations are off frequency.

Some stations may have their packet deviation set larger
than 3Khz and should be informed if that is true.

Don't forget the VOICE downlink frequency (The one we listen on)
is 145.200 right between repeater output frequency of 145.190 and 145.210
That make is hard to copy the Mir voice with a radio.

I don't have a problem receiving the Mir packet on 145.800

Only at the very end of a pass when the doppler is 145.796 Mhz,
do I start to see a few APRS stations but by then Mir is too
weak for me to copy.

A 5 to 15 Khz move up by the Mir (off the band plan edge) would help.

The Mir has a 70 CM radio that now is used as a repeater.

The Mir 145.200/145.800 was a bit of a surprise to most US Hams
and to add more confusion the Mir crew decided to swap the published
uplink and downlink voice frequencies.

>In order to avoid interference with the U.S. Space Shuttle, the Mir
>space station has moved to 145.800 MHz.

That is not the big reason why they moved the frequency. (See Amsat SIG)

Last I read there is lots of work being gone to allow a different
Mir frequency.

APRS is one of the fastest growing area of Ham radio and it's a bit
too late to make many changes. (APRS might be the only growing area
of HAM radio , I don't know ??) We will see after P3D goes up :-)

We do need to work together.

> ing it to clean up maps that we're in the process of making.
>

My reason for suggesting the change in the first place was that Bob has
placed the MapFix program in the \APRS directory but the program would
look for maps in the current directory (\APRS) meaning that one would
need to add a path to work on _any_ map unless of course the program was
moved or copied to the directory needed. I guess it might be better to go
back to the way it was.

>   As such, the inability to load anything NOT named *.map makes MAPFIX29

[snip]
>   We absolutely NEED the ability to load both *.map and *.dat files in
> order to produce usable maps. That's my two-cents, and I'll be forced to

It was not my intention in suggesting the changes to Bob that the file
extension be forced to .MAP. This was an unfortunate bug that was
introduced into the program and I've sent Bob a message with a fix. I
freely take the blame for this one.

1040. APRS on 29.29 MHz FM

From: "Ken Bourne W6HK" <kbourne@earthlink.net>
Date: Sun, 29 Dec 1996 01:04:52 +0000
To: aprssig@tapr.org
Message-ID: <199612290905.BAA16476@armenia.it.earthlink.net>
Rendered body type: text/plain

In response to several recent postings, it would NOT be legal to run
APRS (or any packet, for that matter) on the "wideband" FM (5 kHz

deviation) portion of 10 meters (29.0-29.7 MHz), in accordance with
Part 97.305(c) of the FCC Rules. In other words, forget about
running APRS on 29.29 MHz FM.

The only portion of 10 meters where packet (including APRS) is legal
is 28.0 to 28.3 MHz, and NOT in the FM mode.

Perhaps this would be a good time to petition the FCC for a Rule
change.

73,
Ken Bourne, W6HK

<SNIP>

If another revision to MAPFIX is coming, how about looking at the use of
the mouse when drawing. MAPFIX seems to put in two or three points with
one mouse click (even my bestest, fastest click hehehe). Can this be
tweaked or is it something I am doing???

To: aprssig@tapr.org
Message-ID: <m0veMAb-000Qe2C@nevets.oau.org>
Rendered body type: text/plain

I have found the discussion and criticism of APRS and MIR/AMSAT
amateurs quite informative. Has the discussion of bandwidth and
frequency deviation been reviewed from the viewpoint of MIR
doppler shift into our frequency, and what kind of bandwith
filtering is being used by MIR receivers? Could they be seeing
145.79 +285 with their dial set to 145.800 because their receiver
bandwidth is too wide? It appears the discussion has been one
way so far.

Hi Mike,
  I'm using a card that gives me com1 to com4. For some reason I can't get
Windows 95 to "like" com3. So I have my modem on com1, mouse on com2, and
KPC3 TNC on com4. Had to find IRQ's that didn't conflict. But once that was
done, all is well here. I wish I could get com3 to work though.

       How about checking Hamfests for the connectors?

I found an SMB to SMA, and an SMA to BNC at on from a guy selling microwave
components. Cost was about $10.00. This was cheaper than ordering, since
most places want a minimum $$ on the order plus shipping. It would have
cost me $30-40 for the same parts to order.

Just because the FCC decided to auction off a part of the 2.4-GHz ham
band doesn't mean we should not petition the Commission for what we
want on other bands. Furthermore, if we petition for expanded
privileges on 10 meters, the FCC will notice that we are making use
of that spectrum. If we roll over and play dead, the Commission will
assume we ARE dead, and will give (or auction) the band to another
service. We won't get what we want unless we ASK for it! I suggest,
again, that we petition the FCC for a Rule change, permitting packet
(including APRS) in the FM mode above 29.0 MHz. The FCC has
historically responded positively to petitions that were well
planned, stating precisely what is needed and what the beneficial
results would be.

I haven't plugged my APRS Home Page in awhile, so I will (since you are in
my area).   I have made many maps-  check the Atlanta APRS Home Page at:

http://www.mindspring.com/~rwf

By the way-  It was the first APRS Home Page on the WWW, as far as I know.

I did all of GA in 2,000,000:1 and a lot of it in 100,000:1

There were some of Central FL that I got from a local in Orlando that I
bundled and have on the site too, and I think I put them on TAPR as well.
The file was called CENTFLA.ZIP.

If you need street level maps for your area I can make them too.

We have quite a network up this way, need to get some digis going between
your area and mine

The GPS-45 has an external antenna is is a little better receiver for
walk-about.  The -38 has an internal antenna and often doesn't get as good a
look at the sky as the -45....

1060. TripMate & KPC-3 WORKING!!

From: Bill Kearns <billk@inland.net>
Date: Sun, 29 Dec 1996 16:47:49 -0800

To: aprssig@tapr.org
Message-ID: <199612300047.QAA05825@ns1.inland.net>
Rendered body type: text/plain

Dear Siggers,

After several frustrating weekends, my friend Mike Burton and I have finally managed to get the TripMate GPS unit to work perfectly with the Kantronics KPC-3. We spent a considerable amount of time and effort on this so we documented everything and have prepared a little manual. I believe with this information, almost any tnc can be prepared for use with the TripMate. Special thanks to some of those on the SIG who took the time to respond to my e-mail and help out with their suggestions.

KANTRONICS KPC-3 AND TRIPMATE GPS INTERFACE

The following represents the efforts of WB6JAR and N6KZB, with input from WK5M, to interface the Tripmate to the Kantronics KPC-3. We found that it worked better than anticipated in satellite acquisition and direction of travel. Despite some of the help offered via the APRS SIG group, the following is the ONLY set up that worked with our units.

```
                   PIN OUT CONFIGURATION
  Tripmate                                          KPC-3

pins 2&3 tied together--then both connect to--->      pin 2
pin 5   connects to--->                               pin 7
pin 4   connects to--->                               pin 6
```

MODIFICATIONS TO KPC-3

Install a 4.7 K resistor at position R-48 to make DSR active, (see parts layout for location of R48). It is at the rear, on the board, between the DB9 and DB25 connectors.

KPC-3 COMMANDS

Refer to KPC-3 manual and Command Summary sheets for GPS version 6.0 firmware.

Abaud 4800
INTface TERMINAL, (not NEWUSER mode)
MYcall to callsign-9, (or your desired ssid)
BText is set as needed
BLt 1 through 4 to desired beacon interval in seconds
GPShead 1 through 4, must be changed to $GPRMC
GPSInit needs not to be set, (since pins 2&3 on Tripmate are tied)
LT 1 through 4 gets filled with GPS info so leave blank
LTP 1 through 4 gets set to your local area agreed upon digi paths
LTRack left to factory default
PMode left to factory default
RPrint left to factory default

Final command is INT GPS, then turn TNC off and back on with Tripmate connected. It will take about 2 minutes for first satellite acquisition.

```

1061. Tripmate/APRS Question

From: jpcirone@warwick.net
Date: Sun, 29 Dec 1996 19:58:18 +0000
To: aprssig@tapr.org
Message-ID: <9612300101.AA13086@host>
Rendered body type: text/plain

Based on all of the "rave" reviews people on this SUG gave it, plus the fact that someone put out notice that CompUSA was giving the units 20% off (THANK YOU for that info), and the fact that I read that the next WinAPRS version will somehow interface with Tripmate - I rushed out last nite and bought the only remaining one on the shelf in CompUSA near here. I works great - MUCH better than my Magelleon handheld unit I paid $399 for this past Summer.

The question I have is that since I'm new to APRS - will the new version use the Street Atlas 4.0 as the APRS maps (would be great if it is true) and APRS software will provide the interface to display APRS icons/data on the maps? (I know nothing about how that all works - I'm a PTT HF radio/PK232MBX type guy).

Does it mean that in order to run APRS and tripmate, I need 2 com ports on my notebook - one for the tripmate GPS and the other for the TNC?

Anyone in Northern NJ who can help me learn about APRS?? Any groups or people meet in Northern NJ or Orange/Rockland County of NY?

Hope someone can provide answers - because I have the questions and desire to get up on APRS ASAP.

1062. Season Greetings de W7LUS

Hello to all the Aprs users!

Once again I must explain to many that when I receive your 1 liners while passing through your area or even those that send to me on hf, I don't intentionally ignore your messages. Please understand that when I am "on duty" I am at the wheel. The computer is behind me where I can't see it. I know that wb4apr has made function keys to allow easier replies, however I rather keep my eye on the road and concentrate on DEFENSIVE driving, hi! I am sure you all can realize that it does, in fact, take much more concentration to wheel around 75 feet of what feels like pure lead! I do try to get back to many on hf but usually those on vhf are to far behind me. Many times I'll sit behind the wheel for some 5 hours without any stops, if I can help it. I do appreciate all the messages and attention that I get crossing back and forth and to all corners of the country.

Clay, aa3jy, I have tried what seems like a thousand times to get back an ack from you but never have. I know your way down a vhf path which is kinda inconvient to setup for short periods of usage.

I have had some wondeful visits from many out there. Everytime I pull into Amarillo there is usually Maury, w5ugo (might have messed up his call, anyway the father of the Sproul brothers, our WinAprs authors, etc). Maury and his wife Betty have met me more than once. Sometime I haven't even shut down the truck after parking and there will be Maury or Jimmy, kd5wio at my door. Maury and Betty have taken me into there home for wonderful home cooked meals, a warm quiet bed and usage of the washing facilities! And even after staying with them they have left an open ivitation anytime I can take the time. I might add here that Betty is one proud mother of her "boys" Mark and Keith...did you all know that they are identical twins and are married to identical twins and live just a few miles apart? Keith and Mark, you guys have some wondeful parents that YOU all can be proud of, but I know you "boys" already know that.

A special thanks to Lloyd, kb0mmq, and his wife in Denver, CO for there hospitality. They picked me up and brought me to one of there favorite resturants. I hope to get back there as much as possible and try more of that menu. Lloyd lives in a townhouse and has to have a hidden antenna that has to be in doors. I see you often Lloyd but I guess that noise level makes it tough for you sometimes to hear me especially when I try to send some one liners back to you.

I am terribly sorry but I can't pull the callsigns outa my head of those in Austin, TX. But I had a most delious mexican meal there. The atmosphere was like being in the heart of Mexico but the price wasn't, hi! I think a call was w5rkn....I am really sri guys...I am not seeing you 2 enough to burn your calls in my head...I'll make it up to you all and your wives I promise!

And what happened to Gerry n9vhw, I think now N9GD, the gateway in the Chicago area? He once picked me up at Rosemont Conv. Center and we went to eat then he took me to a grocery store...he seems to be a really great person, I enjoyed him very much. No doubt he is heavy into Aprs. I left him some messages while waiting to load within 10 miles of him a couple of weeks ago but he has never responded. Is he ok?

There are several others that I have the pleasure to meet or just chew the rag on vhf. This part of ham radio
has really made my job a pleasure. I never realized how many are watching me or just keeping up with me on Aprs. Esecially those that are on vhf. There are a few spots where the vhf networks don't have a gateway. If I realize it I will then enable my gateway. Sorry ke4eer! The networks are really growing fast. It looks like Oklahoma City has finally joined us. When on the west coast I notice a growth every visit. I also notice that the n.e. network and the s.e. network are very close to closing in on one another. I think, as noted on Aprs, we do need somemore freqs. Thirty meters just doesn't have what it takes to consistently link the east and west coasts of the country.

Wait til you see my next truck. The plan is hopefully to order a new Peterbuilt or maybe a Kenworth in the next 6 months. The sleeper will be 12 to 14 feet long. It'll be equiped to be totally self sufficient like a camper. Even with a 30amp power cord hookup. Yep, a shower, toilet, 2 burner cook top, convection microwave, apartment size frid and freezer, in motion sateelite tv, build in central vacuum, 7.5 kw diesel gen, settee, and even a telphone between the sleeper and the driver! Plus some other goodies. If you haven't seen what I have now go into the FL Aprsers home page at n2czf and at the very bottom you'll find 3 gifs of my truck. That truck cost me $83,000 the new one I expect will be about twice, $160,000. But that is my home which includes rent and utilities. I have been long out of room...I am longing for that big sleeper. It'll all set on about a 320 to 330 inch wheel base tractor. I am on 228" now with ba 72" sleeper.

I work for North American Van Lines in the High Value Products Division which haul electronics and tradeshows. I am in the "exhibits" group. I sonetimes may sit for a day or so at a convention center waiting my turn. I am also given extra time on the road to make my destinations on time and legally. I laso get payed very very well for waiting and assuming these responsibilities unlike most truckers you all come across everyday. I am proud to say that among the experienced truckers we are concidered the "elite"! If any of you would like to know more about the trucking field just invite me to a darn good hot meal and I'll spill my guts and bent your ears for sure, hi hi!

I am using the Yaesu FT 900AT on HF and have a Kenwood TM733A that is in the shop for the second time for the same symtom. The last time it was a broken solder joint that only allowed about 1 and 1/2 watts output. I guess Kenwood can't stand the punishment of the truck. So I just received from Santa a Yaesu FT8500 with the big "potatoe head" mic! Yaesu claims to be military spected...will see about that. Neat rig though, I think I am going really enjoy this one. The Tnc is a Kam+ with the Aea hsp tied to a Megellan DLX5000. Just got a new laptop a few months ago and really love it too! It is an AST pent 130 Ascentia A Series, with 16meg ram, 1.2 gig hd, touch mouse and 4x cd. The vhf antenna I forget but it is 5/8 wave mounted on the right mirror. On hf is the High Serria which I just moved from the side of the sleeper behind the drivers door to the very center of the grill! My swr now goes flat without the tuner whereas before maybe I could get as low as 1.5:1 but mostly abround 2:1. My big problem was when the hf xmitted the windshield wipers would creep a bit until sometimes they would get passed the park zone and cycle once or twice. So I thought moving the antenna way up front would help. Well it made it worse. Now they cycle everytime it xmits. So I did like the Japenese would do...I installed a switch to break the lead to the intermittent switch. Must be that the coil in the switch is tuned to 10.151! I plan to talk to the truck manufactorer about this. They say I can run up to 100 watts without problems. Guess they don't know about Aprs, eh? Any ideas? I do notice there is a cap between the leads. I disconnected it but it had no effect.

The "Eastern USA North - South Digi", W7LUS, in n.e. GA, will be moved to another, hopefully, better site. Ken, kb4dta, a neighbor, will remove my equip and install it at his qth to get used to my rig. Particulary the tnc - and Hal ST700 modem setup as well as the Yaesu FT980. He then will move it to the Emergency Management Center (911). Sometime I will purchase a Kam for a gateway for the new site. From the site Greenville S.C and Atlanta should be visible on vhf. The antenna will probably be at a height of one full wavelength, 90'!
We hope this will enhance the vhf network into Atlanta. We know it will enhance the vhf network into S.C. and beyond. Ken has promised that the project will get underway right after the first of the year wx

permitting.
At this new site the gateway should be nearly 100 percent dependable. It has its own emergency power and someone that can always reset the tnc should it need it.

Well see...I can bend your ears, can't I? Hi!

Well this "road worrier" will be back on the road Monday the 30th and will deliver near Chicago (Oswego) by the 3rd. Don't forget to watch the beacon page for my itenerary. I try to keep it current!

Hope to see you all out there!

73 Peter W7LUS

Instead of FM, how about 1000 Hz FSK? Ie, take standard Bell 202 tones (1200 and 2200 Hz - current 1200 baud packet) and run them into a SSB transmitter instead of an FM transmitter. Would save a lot of bandwidth and probably be more sensitive.

Rendered body type: text/plain

```
Recently, there's been a thread about MIR switching to 145.800 which then
prompted a comment that APRS operations are kept to a small bandwidth to
minimize QRM to the Satellite band.

Has anyone spec'ed out what this bandwidth should be so that everyone on
freq can tweak his rig to that spec? Ie, should transmit deviation be 3.5
KHz @ 2200 Hz and 1.75 KHz @ 1200 Hz (implies 6 dB/octave pre-emphasis)?
According to Carson's rule, this would be
(2 x 3.5) + (2 x 2.2) = 11.2 Khz bw. (And this neglects the modulation
components of the 2200 Hz tone up around 2800 Hz.) Should it be less? Should
both tones be equal implying no pre-emphasis (true FM)?

I took my first ride this weekend with APRS in the mobile and found that my
tnc did not always decode packets from my fixed audio level radio (TM-733).
I also found that my transmitter set as above wasn't decoded reliably
either. And, at home, I've found that my base transmitter had to be set to
at least 4 KHz to be reliably heard by my nearest WIDE digi. (No, it's not
path problems as I'm on top of a hill and serve as a WIDE myself.) Methinks
some tweaking is in order and we'll probably find paths on existing digis
that don't work today. Only problem is what to tune for.

APRSdos REPLY/COMMENT:  Read the mail.  Any APRS GATEWAY that gates
between VHF and HF CAN NOT BE OPERATED UNATTENDED anyway unless the
gateway is in the special unattended subband.  I dont think 10.151 is...
Thats part of the reason why GATING between VHF and HF is just plain not
desired on APRS...

So the INTENT on 40 meters had nothing to do with GATEWAYS.  ALl I said
was that we need a good 40 m frequency for DAYTIME use of mobiles over
medium distances where 10 MHz skip is too far....

Jim, your statment that MIR never asked anyone before the move is totally
incorrect.  Well, maybe it is exactly correct, hi hi, but over a YEAR ago,
the intended move was announced and discussed ad-nauseum here and
everyhwere else. (amsat-bb).  The decision makers were informed and quite
well aware of the existince of packet operations on 145.79 nationwide.
They were encouraged to operate MIR on 145.805 to be within the satellite
band and to provide 15 KHz separation to 145.79.

Due to overwhelming pressure from Germany and other European countries to
use the 145.800/ 145.200 repeater pair which had been cleared throughout
the commonwealth..  They decided to put MIR on .800 and live with the
interference.

I suggested we move to 145.785 to provide a 15 KHz separation, but that
was vehemetly opposed by Buck ROgers, the packet columnest for CQ magazine
who saw that as an encroachment on his 145.77 turf.  He is not one to
cross lightly with his bully pulpit.

THe final compromise was that APRS has a built in MINIMIZE function that
can be used by specially authorized AMSAT stations to cause all
un-attenede beacons on APRS to shut down for 8 minutes.  This should not
be aproblem since any operator who has emergency or priority traffic can
```

override the minimize with a single key stroke.

Inform the station that due to doppler, he should be listening on 145.805 for the approach of MIR, and that his radio should not then hear activity on 145.79. If the pass is active, then he can tune down as the pass progresses. But at least by monitoring 145.805, he will hear all of MIR when it is active, and will have a quiet squelch the rest of the time...

THe long term objective is to put an APRS Mic-ENcoder with the sepecial MINIMIZE command on MIR! Then whenever they talk, they will automatically clear the frequency in their immediate footprint while at the same time their position will show up on APRS!

So Tell any querying station to put pressure on the MIR team to use APRS to clear the frequency automatically!

1071. APRS and the Weather

From: Rich Casey <casey@acm.org>
Date: Sun, 29 Dec 1996 22:20:28 -0500
To: aprssig@tapr.org
Message-ID: <32C734FC.5063@acm.org>
Rendered body type: text/plain

Greetings all:
Just got my old Ultimeter II working with APRS 7.7e, and have been playing with the weather display commands. It seems that the Weather-Display-JustWx command doesn't toggle on/off immediately, but takes a couple of screen refreshes to take effect. Anyone else notice this?

I'm sending the weather info thru the WB3FYV gateway near Fort Worth. Let me know if it's showing on any US maps thru Dave's gateway.

Wish list: that I could save a WX only map as one of the saved maps. Thought this worked but it doesn't for me.

Incidentally, I was dialing in at 1200 baud on an old laptop via long distance back to Dallas over the holidays to keep up with the SIG. Couldn't go without my daily fix!

Happy New Year!
 73, Rich

Bill - I hav'nt even bought my tripmate yet but I'm
going to. My experience with Magellan Xl has left me
kind of cold. I love the KPC-3 and am pretty familiar
with it. It's too late for Xmas but if this works as
advertised I'll send you an Easter goose. It was most
kind of you and your friends to take the time to do
the hard work and then share it with everyone else.
Beware though: there is a school out there that will
criticise you for not letting everybody learn the
hard way like THEY did. Thanks again Bill.

Well, mainly because I may have to drive 30 plus miles round trip to a
hamfest where I may or may not find the connectors, may or may not find one
for less than I can mail-order one, and wait for weeks, months, or even
years to find one. I would like to use this antenna in the near future. I
will probably just cur the cable and solder a BNC connector on.

1st- Hopes for a good New Year to all

2nd- I fired this question to start a campaign not a war- Ask it a
month or so ago & got little response. So I tried it again & got some
but let's keep it positive.

In the FM portion of 10m-from lower FM band edge to the repeater
pairs, how do we use it & how could we use it ? Yes, let's use all we
have before it may "look" vacant and go elsewhere. Anyone remember
Class A CB- uhf (some 8 mhz in 460's)now reduced to only 8 repeater
pairs (GMRS) wasn't being used so it went elsewhere

Steve Stark queried of us:

> Has there ever been a "rec.radio.amateur.aprs" newsgroup?

No, and I personally would never want one. Just too much of a nightmare with "get rich quick" and XXX-rated ads to ever have one of those. This works better and allows things like archiving every message since day one to search, download, etc.

Now if we could only get the mail handler at TAPR to make the "Reply to" for each message to be the original sender's e-mail address, not the SIG address ....

It can be done! No one will take responsibility for the operation of it. I have been suggesting it for a long time, even contacted the mailing list author and got the code required. Greg Jones says to contact Keith Sproul("He's the Host") and Keith points his finger back at Greg("I'm only just the Host").

Please, no messages telling me to reconfigure my mail program. It is not my mail program. It IS the list server that does this.

We forgot to post this ahead of time,

Rutgers is officially closed from Christmas to New Years and they do a lot
of the special network maintence that cannot be done at other times so
there maybe periods of downtime for the aprs.rutgers.edu web server. If
this happens, please try again later. In some cases it might not be
accessable for an entire day.

1084. APRS7.7e and Weather Commands

From: Rich Casey <casey@acm.org>
Date: Mon, 30 Dec 1996 09:14:45 -0500
To: aprssig@tapr.org
Message-ID: <32C7CE55.60BD@acm.org>
Rendered body type: text/plain

```
Greetings SIG'ers:

Just got my old Ultimeter II working with APRS 7.7e. It went pretty
smoothly, once I changed to a bus mouse. I'm sending the weather info
thru the WB3FYV gateway near Fort Worth. Let me know if it's showing on
any US maps thru Dave's gateway.

I have been playing with the weather display commands. It seems that the
Weather-Display-JustWx command doesn't toggle on/off immediately, but
takes a couple of screen refreshes to take effect. Anyone else notice
this?

Wish list: that I could save a Wx-Display-JustWx map as one of the saved
maps while the others show all activity. Thought this worked but it
doesn't for me.

Incidentally, I was dialing in at 1200 baud on an old laptop via long
distance back to Dallas over the holidays to keep up with the SIG.
Couldn't go without my daily fix!

Happy New Year!
 73, Rich

> it is true) and APRS software will provide the interface to display
> APRS icons/data on the maps?

APRSdos REPLY/COMMENT:  All APRSdos can do is run as a front end COMM
processor.  Hook it to your TNC and the 2nd COMM port to a SECOND computer
running Delorme (or any other GPS/MAPing software).  APRS will do its
usual thing but any object or station you "hook" on APRS will show up one
```

at a time on the Delorem maps...

If there was interest, I could let the Delorem PC and the GPS share a comm
port, so that the front end PC could get by with only 2 comm ports..

No, Netscape for Win 3.1 doesn't do Java. It does have JavaScript, which is a whole 'nother beast. There is a beta for Win 3.1 that does have Java, but it is not stable enough to run javAPRS, which pushes the limits of Java. (The same thing happened to the Mac, Linux, and OS/2 beta versions.) No help for you now, but at least you know it is coming...based on past exerience, less than two months to a stable beta...hang in there.

Mark says, (My interpretation):

How much of the MIR/APRS qrm issue is the result of apathy and the lack of applied technical expertise concerning a technical issue?

Pete says, (Not Mark's interpretation ;-))

The problem may be one of a transitory nature, while MIR is visible from a particular site, but care in setting tx audio gain and deviation levels, calibrating tx and rx frequencies, limiting transmit power to considerably less than "alligator" levels and good front end receiver filtering would make the perceived problem far less a pain to the MIR users and would enhance the overall "efficiency?" of the vhf APRS network.

Back during my good ol' vhf packet days not too long ago, I found that for my purposes a deviation level of 2.5 to 3.5 khz, set with a calibrated communications service monitor, worked well with transmitters and receivers calibrated to transmit and receive on frequency. Special care was given to bypass or compensate for pre emphasis and de emphasis circuitry and mic gain and deviation circuits to assure that the received data tones were not distorted due to clipping or audio frequency response characteristics of the transmitter and receiver. Choosing tranceivers with well designed and tuneable receiver rf sections made the prospect of qrm less probable. The 3 packet operators in my town, all with high profile setups, caused each other little to no grief on adjacent channels, separated by 20 khz.

I suspect that the technical resources available in this armpit of the country can be located and used in any civilized community, if operators were so inclined. If "out of the box plug and play equipment" is to be the norm, and diddle 'til it works, the procedure, the prospect for conditions to improve are dismal, at best.

Granted, no frequency shift due to doppler, 10 khz spacing, or "limitless" radio horizons were contended with, but it never ceased to amaze me how many operators from elsewhere cried about the problems with qrm from adjacent channels. We APRS folks may not be able to change the MIR operational frequency allocation and other issues beyond our control, but we can limit the grief to others by setting up and operating our equipment in a responsible manner that minimizes the impact on MIR operations and grants the consideration to the interests of others, that we want and expect.

One of the aspects of vhf APRS that requires emphasizing, again? is the impact of high power and gain antennas on the receive performance of MIR's packet setup and the APRS vhf networks, in general. The MIR receiver is not "bullet proof" and I would hazard speculation that 50 watts into a gain antenna, in the clear, could hit MIR with a signal strong enough, if off frequency enough, with high deviation and approaching doppler shift, that would, with other similar operations, bombard MIR with a significant amount of qrm from almost any US horizon. There may be a certain amount of ego satisfaction in knowing you are heard and seen in 5 surrounding states and MIR, but it cripples the APRS vhf network (touched on numerous times by Bob and others, and the concepts of which are is in the APRS documentation) and gains few friends in other quarters. APRS has enough vocal opposition, as Bob has made all aware of.

The vhf efficiency of packet operations in my area of the country was also compromised by accomodating the residential HT user at fringe radio ranges and I suspect that same view of the world will cause grief for APRS and MIR users alike. Unless I have missed something, APRS digis should be designed as ears, not mouths.

I cannot be all things to all people all the time, but consideration and care buys me a some of the same in return.

I hope that Mark's concern has not fallen on deaf ears.

You will most likely need a second port or use some form of HSP (hardware single port) switch. I purchased mailorder a PCMCIA serial port card for

mine (wasn't real cheap). Other than the flimsy connector to the card, it
doesn't work too bad.
  But one or the other options will do.

1090. Tripmate and HP200LX + Adaptive Tracker Update

From: bob <w2g3zfj@unix.asb.com>
Date: Mon, 30 Dec 1996 17:24:28 -0500
To: aprssig@tapr.org
Message-ID: <32C8411C.4920@unix.asb.com>
Rendered body type: text/plain

Hi Folks

I took my recently acquired Tripmate out for a run connected to my
HP200LX palm top to see how it would go. General result, excellent!

I wasn't interested in having the TNC connected at present, was more
interested in how the 200LX would handle the data stream from the
Tripmate and how the map would be updated.

I set the screen update rate to every 2 secs and initialised the
Tripmate with the O-C-G screen by sending ASTRAL. I setup aprs (ver 77e)
with no tnc and the GPS conneceted to com1. The GPS Plot status display
was excellent and worked like a charm.

Next time I'll try it with the HSP and the KPC-3.

73 de bob w2/g3zfj

PS. If anyone is following the Adaptive Tracker saga I have had a few
more bugs. the last one I found out today, was due to the feature that
the Paccom TNC-2 code waits for the duration of the previous loc e
command to runout BEFORE it actions the new interval. For example if I
set loc e 90 (every 900 seconds) and the sent loc e 3, it would wait for
the remainder of the 900 secs to time out before setting the new rate.
My work-around is to issue a RESTART command after the new interval and
that seems to work OK. But, its been fun! I could have done with a GPS
simulator rather than driving the car around the block each time I
wanted a moving fix!

I too had a problem with one machine and com3. The answer was tricky, but
is now obvious. I had an ATI Graphics Expression video card, which used the
S2 chip set.
The S2 chip set (boy I hope I have that correct, its been a while) uses one
address that is in the com3 range. One normally thinks of com3 as being
3E8, when of course it is really 3E8 through 3F8. The S2 chip set uses one
address in that range, and CANT be changed.

I reasoned that using an old fashion 450 UART with no buffering would not
use addresses beyond 3E8, but have not been able to solve this problem that
way. I just survive without com3 on that computer. Good luck.

I checked into this about two weeks ago (talked with a fellow
from Rockwell who knew specifically about DeLorme's product) and
I was told that DeLorme is using Rockwell's Zodiac Chipset but is
not using the Jupiter board -- which is Rockwell's board-level
OEM product using the Zodiac Chipset.  So, you cannot get
an OEM GPS board for as little $$$ as DeLorme is getting theirs
because they spend their own time and money developing the
board from the Zodiac chipset.

Regards,
  Will, N3XLM

1099. Making Maps

From: Dave VanHorn <dvanhorn@cedar.net>

```
I know I'm gonna hate asking this, but:

How do you draw a LINE in mapedit?

I have found my origin and range and pixels/degree, but I have
only been able to work out how to add points to the map.

My next problem will be using my Wacom SD digitizer (12x18") in
mapedit. It's resolution is 2540 LPI fixed. I can make it operate in
several different modes relative to the screen. The most intuitive is
to make the tablet area match the screen, but that means an unequal
scaling in the two axes.

Anybody got any suggestions?

1100. APRS and WX stations? (Bob Brun... please read)

From: "Alan K. Adamson" <ne1h@tornado.ne1h.radio.org>
Date: Tue, 31 Dec 1996 00:16:35 -0500
To: "'aprssig@tapr.org'" <aprssig@tapr.org>

Rendered body type: text/plain

All,

I have looked back through the documentation for APRS, but no where are all of the text identified defined for WX stations. I want to do a couple of things with the data, but I can't seem to find the complete listing of the protocol. Bob, are you listening and can you send it or update the protocol.txt or wx.txt file to reference it. I have found bits and pieces of about three different identifiers looking back over the various version of documentation that I could find, but I don't know which ones are the right one and which may no be valid.

Can someone please help?

Thanks,
Alan
